

Figure S4. Actin organization in CHO-K1 cells and its absence in A745 cells following incubation with FHV and Tat peptides. Cells were treated with 10 μ M peptide for 2.5 min at 37 $^{\circ}$ C, and actin cytoskeletons were then stained with phalloidin-TRITC after fixation of the cells using 4% paraformaldehyde. Arrows show lamellipodia formations. Cells treated in the absence of peptides were taken as controls.
