

Figure S7. Transfection of tumor cells with E6(40)VE-LUC, followed by GCV treatment, did not enhance the growth inhibition induced by γ irradiation, Bleo or Dx. LoVo and A375N cells were transiently transfected with E6(40)VE-LUC and exposed to different levels of γ radiation (a and b), Dx, or Bleo (c and d), in the presence or absence of administration of 10 or 50 μ M GCV. "Growth fraction" indicates the percentage of surviving cells, compared to control cells.
