

Supplemental Figure 1

Supplementary Fig. 1. HBP1 and c-Myc interact in yeast cells. Yeast cells containing cDNA expressing HBP1 were mated to yeast containing either c-MycGAL4DB or c-Myc^{ΔTAD}GAL4DB and were plated on -Leu-Trp-His + 25 mM 3AT plates to assess expression of the *HIS3* reporter gene. As a control, yeast containing the pEXPAD-502 plasmid which harbors a GAL4 activation domain (GAL4AD) without a fused cDNA (empty vector) were also mated to yeast containing either bait plasmid. Growth on the plate is shown.
