

**Table S2. Macroecological traits of the Danish avifauna.**

Rows represent breeding species included in the analysis.  $25 \text{ km}^2$  = number of grid-cell occurrences at the  $5 \times 5 \text{ km}^2$  spatial grain (n = 2003 grid cells total;  $100\text{km}^2$  = number of grid cell occurrences at the  $10 \times 10 \text{ km}^2$  spatial grain (n = 620 grid cells total). Territoriality = territorial or colonial status. Body mass = adult body mass in grams (averages given for sexually dimorphic species). N = estimated number of breeding pairs in Denmark. Foraging guild and congeneric guild assignments were made *a priori* by C. Rahbek and J. Fjeldså.
