

Supplementary Figure 4

GpUL141 is expressed with early-late phase kinetics. HFFFs were infected with HCMV strains Toledo or AD169 for the times indicated. The immunoblot experiment detects expression of gpUL141 in the absence (M) or presence (+P) of the inhibitor of the HCMV DNA polymerase phosphonoformic acid (300 g/ml). Expression in the presence of an inhibitor of HCMV DNA replication is evidence of early phase expression
