

Figure S2. Male gametocytemias (A) and female gametocytemias (B) in the transfection control and a *PfPuf2* disruptant (Δ Rep8-1). Male and female gametocytes were differentiated by IFA using antibodies against the α -tubulin II and Pf230. For each time point, * and ** indicate significant difference between the two parasite clones at $P = 0.05$ and 0.01 levels, respectively (t -test).
