

enzymes. We are using the poly U system to determine whether the code for phenylalanine is the same in different species.

Summary.—Phenylalanine-soluble RNA was shown to be an intermediate in the cell-free synthesis of polyphenylalanine directed by a synthetic template RNA, polyuridylic acid.

We wish to thank Mrs. Linda Greenhouse for her excellent help in performing some of the analyses.

* NATO postdoctoral fellow.

† The following abbreviations are used: Polyuridylic acid, poly U; polycytidylic acid, poly C; RNA, ribonucleic acid; DNA, deoxyribonucleic acid; sRNA, soluble ribonucleic acid; RNAase, ribonuclease; ATP, adenosine triphosphate; UTP, uridine triphosphate; CTP, cytidine triphosphate; and GTP, guanosine triphosphate; PEP, phosphoenolpyruvate; and PEP kinase, phosphoenolpyruvate kinase.

‡ That this may be the case is suggested by preliminary experiments performed in collaboration with Harry Gelboin showing that poly U does not stimulate incorporation of C¹⁴-phenylalanine in a rat liver amino acid-incorporating system. Similar results have been obtained by S. Ochoa (personal communication).

ERRATUM

In the article entitled "On the Energy Transfer in Biological Systems," by John Avery, Zoltan Bay, and Albert Szent-Györgyi, which appeared in the November issue of volume 47 (1961), the equation at the top of page 1743 should read:

$$\int \Psi_f^* H' \Psi_i d\tau = \int (\Phi_0 \xi_1)^* H' (a_1 \Phi_1 + a_2 \Phi_2 + \dots + a_N \Phi_N) \xi_0 d\tau = \\ a_m \int (\Phi_0 \xi_1)^* H' \Phi_m \xi_0 d\tau.$$
