General Experimental. 4-Nitrophthalic anhydride was from TCI America (Portland, OR). Dimethylformamide (DMF), tetrahydrofuran (THF), and dichloromethane (CH_2Cl_2) were drawn from a Baker CYCLE-TAINER solvent delivery system. All other reagents were obtained from Aldrich Chemical (Milwaukee, WI) or Fisher Scientific (Hanover Park, IL) and used without further purification. $\text{NaHS}\cdot\text{H}_2\text{O}$ was obtained as “sodium hydrosulfide hydrate” (Aldrich; Product 161527). $\text{HCl}(\text{aq})$ was prepared by dilution of concentrated $\text{HCl}(\text{aq})$ into H_2O in the indicated proportions.

Thin-layer chromatography was performed using aluminum-backed plates coated with silica gel containing F_{254} phosphor and visualized by UV illumination or staining with I_2 , ceric ammonium molybdate, or phosphomolybdic acid. Flash chromatography was performed by using open columns loaded with silica gel-60 (230–400 mesh), or on a FlashMaster Solo system (Argonaut Inc., Redwood City, CA) with Isolute Flash Si II columns (International Sorbent Technology Ltd., Hengoed, Mid Glamorgan, UK). The term “high vacuum” refers to a vacuum ($\leq 1 \text{ mm Hg}$) achieved by a mechanical belt-drive oil pump. The term “concentrated under reduced pressure” refers to the removal of solvents and other volatile materials using a rotary evaporator at water-aspirator pressure ($< 20 \text{ mm Hg}$) while maintaining the water-bath temperature below 40°C . The term “concentrated under high vacuum” refers to the removal of solvents and other volatile materials using a rotary evaporator at high vacuum while maintaining the water-bath temperature below 40°C .

NMR spectra were obtained with a Bruker DMX-400 Avance spectrometer in the National Magnetic Resonance Facility at Madison (NMRFAM), or with Bruker AC-300 or Avance-360 spectrometers in the Magnetic Resonance Facility (MRF) in the Department of Chemistry. Mass spectrometry was performed with a Micromass LCT (electrospray ionization, ESI) mass spectrometer in the Mass Spectrometry Facility in the Department of Chemistry. Analytical HPLC was performed on a system from Waters (Milford, MA) with an $250 \times 4.6 \text{ mm C-18 Microsorb}$ column from Varian (Palo Alto, CA) using a linear gradient of CH_3CN (20–60% v/v) in H_2O . HPLC solvents contained TFA (0.1% v/v).

2',7'-Diethylfluorescein Diacetate (6). 4-Ethylresorcinol (**4**, 5.00 g, 36.2 mmol) and phthalic anhydride (**5**, 2.68 g, 18.09 mmol) were dissolved in methanesulfonic acid (40 mL). The reaction mixture was stirred at 85°C for 48 h. The dark brown solution was poured into ice water (250 mL), and the yellow-brown precipitate was collected by filtration and air dried. This material was dissolved in acetic anhydride (80 mL) and pyridine (80 mL), and stirred at 85°C for 4 h. The reaction mixture was concentrated under high vacuum, and the brown residue was dissolved into CH_2Cl_2 . This solution was washed with $\text{HCl}(\text{aq})$ (5% v/v), water, and saturated brine. The organic layer was then dried over anhydrous $\text{MgSO}_4(\text{s})$ and concentrated under reduced pressure. The brown residue was suspended in cold EtOH (300 mL), and the resulting pale brown solid was collected by filtration. This material was purified further by crystallization from $\text{CHCl}_3/\text{MeCN}$ (1:1) and the crystals were washed with cold EtOH (excluded from the mother liquor). The mother liquor was concentrated under reduced pressure and a second crop of crystals was obtained by crystallization from acetic anhydride. The combined crystals were dried under high vacuum.
