Supporting Material

Cavity hydration free energy $\Delta G_{\text{hyd}}^{0 \rightarrow n}$ has the four terms:

$$\Delta G_{\text{hyd}}^{0 \rightarrow n} = \Delta G_{\text{cavity}}^{0 \rightarrow n} - n\Delta G_{\text{bulk}}^{0 \rightarrow 1} - nk_{\text{B}}T \ln \left[\rho_{\text{bulk}} (2\pi k_{\text{B}}T / k_{\text{harm}})^{3/2} \right] + k_{\text{B}}T \ln n!.$$

The first term $\Delta G_{\text{cavity}}^{0 \rightarrow n}$ is the sum of three components. These were calculated from the three different processes in which the restraining, electrostatic and vdW potentials were changed, respectively,

$$\begin{aligned} (U_1^{\text{ele}}, U_1^{\text{vdW}}, 0) &\rightarrow (U_1^{\text{ele}}, U_1^{\text{vdW}}, u^{\text{res}}) : (\text{res}) \\ &\rightarrow (U_0^{\text{ele}}, U_1^{\text{vdW}}, u^{\text{res}}) : (\text{ele}) \\ &\rightarrow (U_0^{\text{ele}}, U_0^{\text{vdW}}, u^{\text{res}}) : (\text{vdW}) \end{aligned}$$

All the components are shown in the following Tables S1 (rigid) and S2 (flexible).

Table S1: Free energies calculated with the rigid model and their components [kcal/mol].
