

Table S1. Mass spectrometry-based protein identifications and scores for epaulette shark cerebellum proteins that were regulated in response to episodic anoxia or hypoxia. Data from both post-source decay (PSD) and collision-induced dissociation (CID) MS/MS peptide fragmentation modes were searched against the NCBI non-redundant sequence database (chordates). Sequence coverage for peptide mass fingerprint spectra (% of overall sequence) are shown in parentheses for Mascot matches. The numbers of de novo sequences from MS/MS spectra that matched the protein in PEAKS Studio v4.5 searches are shown in parentheses after PEAKS scores.

Table S4. Expression ratios for epaulette shark cerebellum proteins that were regulated by episodic anoxia (A1+24) or hypoxia (H1+24; H1+H2+24) but that were not identified using mass spectrometry. Values in bold font met the statistical ($p < 0.05$) and expression ratio (< 0.67 or > 1.5) criteria for mass spectrometry analysis in that treatment. Variable importance in the projection ranks (VIP) based on a partial least squares discriminant analysis are also presented.
