

**Supplementary Figure 1:** Relative expression levels of miR-192 and miR-215 in proximal tubular cells (NRK52E), mouse primary mesangial cells (MCs) and conditionally immortalised human podocytes. The level of miR-192 shown in each case is relative to miR-215 which has been arbitrarily assigned a value of 1.

**Supplementary Figure 2:** Relative expression levels for PCNA in control and TGF $\beta$  treated NRK52E cells. The level of PCNA is significantly reduced with TGF $\beta$  treatment. (\* $p < 0.05$  compared to control).
