Supplemental Figure S2. Nucleotide sequence and deduced amino acid sequence of *OsDVR*.

Numbers at left refer to the positions of nucleotides. Letters in the box indicate the nine nucleotides and three amino acid residues deleted in 824ys mutant; Italic letters indicate the putative chloroplast-targeting sequence of 58 amino acid residues at its N terminus.

Supplemental Figure S3. Alignment of the deduced amino acid sequence of OsDVR and its homologues. Identical residues were boxed in black, similar residues ($\geq 75\%$ identical) were highlighted in gray. The deletion of three amino acid residues (Lys, Val and Pro) was indicated with asterisks at the mutation site of 824ys mutant. Accession numbers for the respective protein sequences are as follows: *Oryza sativa* (OsDVR, Os03g22780, ADE43128); *Sorghum bicolor* (XP_002465274); *Zea mays* (PCB2, NP_001148282); *Arabidopsis thaliana* (DVR, At5G18660, NP_197367); *Synechococcus* sp. WH 8102 (SYNW0963, NP_897056); *Chlamydomonas reinhardtii* (XP_001690168); *Chlorobium tepidum* TLS (BciA (CT1063), NP_661954); and *Rhodobacter sphaeroides* (ZP_00006667).
