General Experimental Details. All reactions were run in flame- or oven-dried glassware under an inert atmosphere of argon using standard syringe and septa techniques, unless otherwise stated. All commercially available reagents were used as received unless otherwise stated. Tetrahydrofuran (THF) and dichloromethane (CH_2Cl_2) were degassed with Ar and then passed through two 4×36 inch columns of anhydrous neutral alumina A-2 (8 \times 14 mesh, LaRoche Chemicals; activated under a flow of Ar 350 °C for 12 h) to remove H_2O according to the procedure described by Grubbs.¹ Dimethylformamide (DMF) was distilled over BaO. Trimethylsilylacetate (TMSOAc) was distilled under an inert atmosphere of argon. Acetic acid (AcOH) was distilled over CrO_3 . Triphenylsilyl perrhenate ($\text{O}_3\text{ReOSiPh}_3$) was prepared according the procedure described by in our previous work.² (1*S*,2*S*,5*R*)-1-(1-methylallyl)menthol and (1*R*,2*R*,5*S*)-1-(1-methylallyl)menthol were prepared according to McDonald's procedure.³ Compounds **2**,⁴ **18**,⁵ **19**,⁵ **18a**,⁵ **19a**,⁵ and **22**⁶ were prepared according to published procedures. Column chromatography was performed using forced flow (flash chromatography) of the indicated eluant on Sorbent Technologies 230–400 mesh silica gel. Thin layer chromatography (TLC) was performed on Whatman 250 μm layer silica gel plates and developed plates were visualized by vanillin or *p*-anisaldehyde. All melting points (mp) were obtained using a Mel-Temp melting point apparatus and are not corrected.

^1H NMR spectra were recorded at either 500 or 600 MHz and ^{13}C NMR spectra were recorded at either 125 MHz or 150 MHz and were referenced to residual solvent peaks. Chemical shifts (δ) were referenced to the residual solvent peaks. Data are presented as follows:

Acetal 28. 2,2,6,6,-Tetramethylpiperidine-1-oxyl (7.7 mg, 0.049 mmol) was added to a solution of diol **26** (70.0 mg, 0.250 mmol) and [bis(acetoxy)iodo]benzene (87.0 mg, .0270 mmol) in CH_2Cl_2 (2 mL). After 8 h, 5 mL of saturated aqueous NaHCO_3 was added and the mixture was extracted with CH_2Cl_2 (3×10 mL). The combined organic fractions were then dried with MgSO_4 and concentrated under reduced pressure. The crude brown residue was then dissolved in 2 mL of MeOH and DL-camphorsulfonic acid (5.7 mg, 0.025 mmol) was added. After 20 h, saturated aqueous NaHCO_3 (5 mL) was added and the mixture was extracted with CH_2Cl_2 (3×10 mL). The combined organic phases were then dried with MgSO_4 and concentrated *in vacuo*.
