

Socio-economic disparities in obesity and underweight

Supplementary Appendices

Table 1S: Urbanicity - Relative risk ratios (RRRs) and 95% confidence interval (CI) from multinomial multivariable model (using BMI 18.5-24.9 kg/m² as the referent) regressing BMI classification on urbanicity with clustered robust standard errors (CRSE) of primary sampling units (PSUs), adjusted for gender, age strata, and income quintile, World Health Survey, 2002–2003.

Table 2S: Sex -Relative risk ratios (RRRs) and 95% confidence interval (CI) from multinomial multivariable model (using BMI 18.5-24.9 kg/m² as the referent) regressing BMI classification on male sex with clustered robust standard errors (CRSE) of primary sampling units (PSUs), adjusted for urbanicity, age strata, and income quintile, World Health Survey, 2002–2003.

Table 3S: Income - Relative risk ratios (RRRs) and 95% confidence interval (CI) from multinomial multivariable model (using BMI 18.5-24.9 kg/m² as the referent) regressing BMI underweight classification on income quintiles (using highest income quintile as the referent) with clustered robust standard errors (CRSE) of primary sampling units (PSUs), adjusted for urbanicity, age strata, and sex, World Health Survey, 2002–2003.

Table 4S: Income - Relative risk ratios (RRRs) and 95% confidence interval (CI) from multinomial multivariable model (using BMI 18.5-24.9 kg/m² as the referent) regressing BMI overweight classification on income quintiles (using highest income quintile as the referent) with clustered robust standard errors (CRSE) of primary sampling units (PSUs), adjusted for urbanicity, age strata, and sex, World Health Survey, 2002–2003.

Table 5S: Income - Relative risk ratios (RRRs) and 95% confidence interval (CI) from multinomial multivariable model (using BMI 18.5-24.9 kg/m² as the referent) regressing BMI obese classification on income quintiles (using highest income quintile as the referent) with clustered robust standard errors (CRSE) of primary sampling units (PSUs), adjusted for urbanicity, age strata, and sex, World Health Survey, 2002–2003.

*Indicates significance ($p<0.05$) of at least one income quintile compared to wealthiest quintile.

Bolded indicates significance ($p<0.05$).

^aIncome quintiles created sparse cells for regression analyses.

^bAdjusted using age as a 3-category variable (18-29 years old; 30-49 years old; 50 plus).

^cRobust standard errors.

^dAdjusted using age as continuous variable.

^eUnadjusted for urbanicity.

^fUnadjusted for income.
