## Plasmids

Name	Description	Reference
pGBts-rep	pGB2ts vector carrying the <i>rep</i> gene under the control of its own promoter	(Petit and Ehrlich, 2002)
pAM-rep	pAM34 vector carrying the <i>rep</i> gene under the control of its own promoter	(Lestini and Michel, 2008)
pAM-priA	pAM34 vector carrying the <i>priA</i> gene under the control of its own promoter	(Grompone <i>et al.</i> , 2004)
pEM001	pACYC184 vector carrying the <i>rnh</i> (RnaseH) gene under the control of its own promoter	(Masse <i>et al.</i> , 1997)
pRL385	pUC vector carrying the <i>rpoB</i> wild-type gene under the control of Pr- <i>lac</i> (IPTG inducible) promoter	(Bartlett <i>et al.</i> , 1998))

The plasmid pRL385 (a pUC derived plasmid that carries the *rpoB* wild-type gene under the control of Pr-lac (IPTG inducible) {Bartlett, 1998 #11951}), was introduced by transformation in the four *rep uvrD recF rpo<sup>mut</sup>* strains, selecting on MM ampicillin (Ap) at 37°C. Transformants were grown ON in MM Ap at 37°C and plated on MM Ap or LB Ap plates, containing (+IPTG) or not (- IPTG) IPTG. MM plates were incubated at 37°C and LB plates at 25°C. The number of colony forming units (cfu) is indicated here. Since the *rep uvrD recF* Rpo<sup>+</sup> cells are cryo-sensitive on LB at 25°C, complementation of an *rpoB* mutation by the wild-type *rpoB* allele is expected to confer cryo-sensitivity.

**Table S3 Out of the 5 different *rpo<sup>sup</sup>* mutations, only *rpoB*<sup>H447R</sup> suppresses the auxotrophy of a *relA spoT* mutant.**

(a) Because the experiment is done in a JJC40 background, which requires histidine, leucine and arginine for growth, these three amino acids were included in the MM glucose plates.

(b) The *rpoB<sup>sup</sup> relA spoT* mutants were propagated on LB and tested on MM glucose supplemented with histidine, leucine and arginine; they are also described in Table S1.
