**SUPPLEMENTAL DATA 3:** Phylogenetic relationship of group A, B, C and D rotaviruses based on the deduced amino acid sequences of the structural proteins VP1 (A), VP2 (B), VP3 (C), VP4 (D), VP6 (E) and VP7 (F). The branches are labelled with the strain abbreviations and their rotavirus group is indicated. The specific hosts of the strains and their GenBank accession numbers are listed in Supplemental Data 2. The trees are scaled in amino acid substitution units and were constructed using MEGALIGN software (CLUSTAL W method, Identity residue weight table, 1000 trials and 111 random seeds in bootstrap analysis, bootstrap values of >50% are indicated at the knots of the branches).

SUPPLEMENTAL DATA 4: Phylogenetic relationship of group A, B, C and D rotaviruses based on the deduced amino acid sequences of the non-structural proteins NSP1 (A), NSP2 (B), NSP3 (C), NSP4 (D) and NSP5 (E). Labelling and construction parameters of the trees are as in Supplemental Data 3.

**SUPPLEMENTAL DATA 5:** Alignment of the amino acid sequences encoded by the group A, C and D rotavirus genome segments. The sequences were retrieved from the group A rotavirus (RVA) strain Wa, the group C rotavirus (RVC) strain Bristol and the group D rotavirus (RVD) strain 05V0049. The amino acid numbering is indicated left. Amino acid positions, which are identical in all groups are indicated in bold face above the sequences.

5A: Alignment of the VP1 sequences. The motifs A, B, C, D and F are boxed. Amino acid residues, which are involved in recognition of the 3'-terminal genome segment sequence UGUGACC in the group A rotavirus are shaded in grey.

5B: Alignment of the VP2 sequences.

5C: Alignment of the VP3 sequences. The KXTAMD and KX[P/N]G motifs are boxed.

5D: Alignment of the VP4 sequences. The region of trypsin cleavage of VP4 into VP8\* and VP5\* in group A rotaviruses is boxed and amino acids potentially serving as cleavage sites are shaded grey.

5E: Alignment of the VP6 sequences. The histidine residue at position 153, which is involved in zinc binding in group A rotaviruses, is shaded grey. The group-specific antigenic regions identified in group A rotaviruses are boxed.

5F: Alignment of the VP7 sequences. Regions A, B and C implicated in neutralization of group A rotaviruses are boxed. The glycosylation site NST present in group A and C rotaviruses is shaded grey. Conserved cysteine residues are marked with an asterisk.

5G: Alignment of the NSP1 sequences. The NSP1 sequence of the avian group A rotavirus strain 02V0002G3 is included and identical amino acids in this sequence and the group D rotavirus NSP1 sequence are marked with an asterisk. The region with limited sequence identity to TFA-1 in the avian rotavirus NSP1 is boxed. Conserved amino acid residues of the RING finger domain are shaded grey.

5H: Alignment of the NSP2 sequences. The NTPase domain is boxed and functionally important conserved amino acid residues are shaded grey. The proposed catalytically active histidine residue is marked with an arrow.

5I: Alignment of the NSP3 sequences. The RNA-binding domain is boxed. The amino acid residues proposed to be involved in group-specific recognition of the mRNA 3'-terminal ends in group A and C rotaviruses are marked with an asterisk.

5K: Alignment of the NSP4 sequences. Potential glycosylation sites in group A and D are shaded grey. The NSP4 sequence of the group B rotavirus strain Bang373 is included and identical amino acids in this sequence and the group D rotavirus NSP4 sequence are marked with an asterisk.

5L: Alignment of the NSP5 sequences. Serine residues, which are phosphorylated in group A rotavirus NSP5, are shaded grey.
