Supplementary Materials

Introduction

To illustrate the utility of our method in a typical scenario, we further tested M-SPLIT on a larger experimental *Yeast dataset*, generously made publicly available in Tranche/ProteomeCommons by researchers at the University of Vanderbilt. In brief, a tryptic digest of a *Saccharomyces cerevisiae* was analyzed on an LTQ Orbitrap XL mass spectrometer (Thermo Fisher Scientific) and MS/MS spectra were acquired using a data-dependent scanning mode in which one full MS scan (m/z 3002000) was acquired on the Orbitrap at a resolution of 60 000, followed by 8 MS/MS scans collected on the LTQ. M-SPLIT was ran with default parameters against the Yeast spectral library from NIST (*ver.5/4/2009*); a 3 Da parent mass filter was used to pre-filter the library before the search.

This documents contain annotated mixture spectra identified by M-SPLIT. Each page contain three spectra. The middle spectrum is the identified mixture spectrum from yeast dataset. The top and bottom spectra are two spectra from NIST spectral library that best matched to the mixture spectra. In beginning of each page the name/scan number, the precurosr m/z of the mixture spectrum, the cosine similarity between the mixture spectrum and the two spectra from the library and the estimated α is also shown.
