

Zhu et al, Supplementary Figure S3

Supplementary Fig. S3 Recombinant GC4 IgG1 retains binding specificity of the parental scFv. FACS analysis was performed to determine binding of GC4 IgG1 (1 $\mu\text{g/ml}$) in the presence of the parental GC4 or four other scFvs (50 $\mu\text{g/ml}$ each). Binding was detected by fluorescently labeled anti-human IgG antibody. Normalized mean fluorescence intensities were used to compare binding results. Error bars indicate standard deviations of duplicated experiments. *, $P < 0.05$.
