

Figure S1

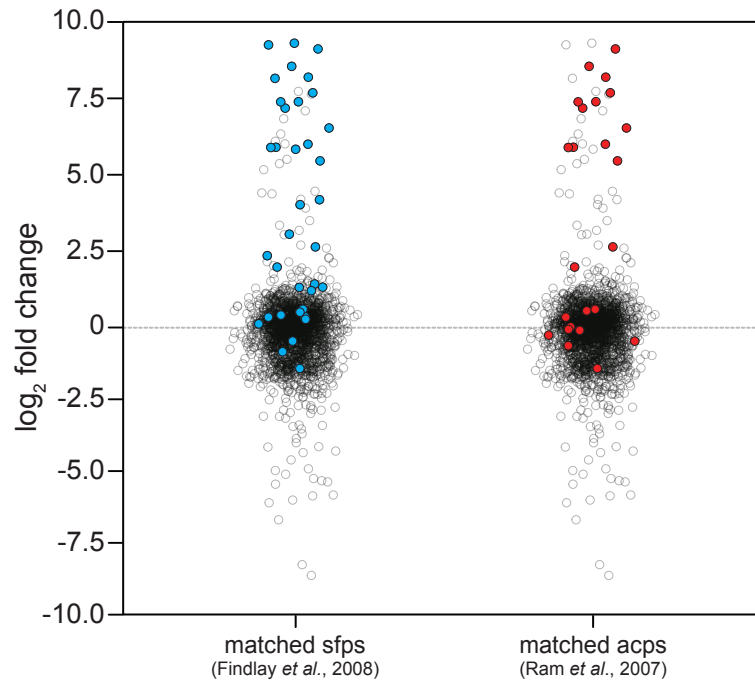

Figure S1. Comparison of male vs. female protein ratios of w^{1118} flies with datasets of previously identified sfps (12) and acps (45). Male - specific enrichment was found for matched sfps (blue dots, on average ~14 fold, n=36) and matched acps (red dots, on average ~12 fold, n=24) compared to male vs. female protein ratios of w^{1118} flies (n=2106). Note that some proteins overlap between the acp and sfp datasets.
