

**Figure S3.** Quantitative PCR study of the ICCA.SRb subregion in the largest ICCA family (Pedigree A).[2] DCt values are indicated for each individual carrying (asterisk) or not the disease haplotype. Black circles and squares indicate females and males affected with benign infantile convulsions (left-filled), paroxysmal dyskinesia (right-filled), or both (fully filled). Empty circles and squares indicate unaffected females and males, respectively.
