

SUPPLEMENTAL FIG. S1. Adipocytes have no effect on lactogenic differentiation of mammary epithelial cells. **(a)** Tubules were treated with mammary epithelial cell (MEC) medium, adipocyte maintenance medium (non-conditioned medium [CM]), or adipocyte-CM for 24 h and assayed for functional differentiation via quantitative reverse transcription (RT)-polymerase chain reaction analysis of β -casein expression. **(b)** Tubules were treated with lactogenic hormones in the presence of non-CM or CM for 24 h and assayed for β -casein expression. Results are normalized to cultures in the absence of lactogenic hormones. n.s., no significant difference.
