

Supplemental data

Methods

Culture of *Drosophila S2* cells

Drosophila S2 cells were cultured at 24°C in 1x Schneider's *Drosophila* medium (Gibco/BRL), supplemented with 10% fetal bovine serum (heat-inactivated) and 1% Penicillin/Streptomycin (Invitrogen).

For transfections for luciferase assays, 1.3×10^6 cells per well (in 0.65 ml) were plated in 24-well plates. Cellfectin (Invitrogen) was diluted 1:5 in serum-free medium to a final volume of 21 μ l and incubated for 45' at room temperature, then mixed with 21 μ l of serum-free medium containing the appropriate plasmids and dsRNA, incubated for another 15' at room temperature and finally diluted into 378 μ l serum-free medium and added to the washed cells; 16 h later, the transfection mix was replaced by complete medium and the incubation was continued for the indicated duration of time (typically 48 hours). Each plasmid solution typically contained 650 ng of each of the wt-RLuc and Δ E-FLuc reporters, 130 ng tubulin-RLuc (where needed), and 40 ng dsRNA (where needed); for overexpressions a total of 1.3 μ g DNA (consisting typically of a 1:1 mix of the "driver" plasmid tub-GAL4 on one side, and the different UAS-cDNA plasmids on the other side) was added to each well. ; where indicated, dsRNA was added at 40 ng/ 10^6 cells.

For samples to be analysed by Western blotting or immunoprecipitations, 5×10^6 cells (in 1 ml) were plated per well into 6-well plates; transfections were done in a final volume of 1 ml containing 10 μ l Cellfectin and a total amount of 10 μ g plasmid DNA (3.3 μ g tub-GAL4, and 3.3 μ g of each expression plasmid, or pCaSper4 to bring the total DNA mass to 10 μ g). Cells were typically harvested 48 hours after transfection.

For qRT-PCR analysis of RNAi-treated cells, 5×10^6 cells were plated in each well of a 6-well plate and incubated with 10 μ g dsRNA in 1 ml serum-free medium for 30'. Two ml of complete medium were then added and the cells harvested after the indicated incubation periods.

Analysis of target gene expression.

Luciferase assays: cells were harvested typically 48 h after transfection, washed in 1x PBS and lysed for 15' in 100 μ l 1x Passive Lysis Buffer (Dual-Luciferase Reporter Assay System, Promega). Ten μ l of each lysate was transferred to luminometric 96 well plates (Greiner) and relative reporter gene expression was determined on a Wallac luminometer. The luminometer protocol was adjusted to disperse 50 μ l of each luciferase substrate per measurement. Each transfection was performed in duplicate, and all values are indicated as averages of duplicates with standard deviations.

qRT-PCR: cells were flushed off the plates at the indicated times after transfection, lysed in 1 ml Trizol reagent (Invitrogen) and total RNA was extracted and purified according to the manufacturer's protocol. After precipitation, RNA was redissolved in 20 μ l RNase-free water and 10 μ g of RNA were subjected to a DNase digestion (Ambion TURBO DNA-free-kit). The quality of the purified RNA was confirmed on Bioanalyzer Nano 6000 chips (Agilent). cDNA was synthesised starting with 1 μ g template RNA using the Omniscript Reverse Transcription Kit (Qiagen) and random hexamer primers; as control 1 μ g of template RNA was mock reverse-transcribed. qRT-PCR reactions were performed on an ABI 7900 Real Time PCR Instrument (Applied Biosystems) using the SYBR GREEN PCR Master Mix (Applied Biosystems), and data were analysed with SDS

Supplement "Myc and dHCF"

2.0 software (Applied Biosystems) and Microsoft Excel, using the $\Delta\Delta Ct$ method. Expression levels of actin5C and Sec24 served as internal references. Primers are listed below.

Protein analysis.

Western blot: cells were harvested at the indicated time points and washed with 1x PBS, lysed in Laemmli sample buffer by boiling for 5' at 95°C and analysed by SDS-PAGE and immunoblotting, using the Enhanced Chemiluminescence kit (Amersham) or fluorescently labeled secondary antibodies. Blots were then either exposed to X-ray films, scanned with a CCD camera (Fuji LAS-3000), or analysed with an Odyssey reader (Li-Cor Biosciences).

In vitro interactions: ^{35}S -methionine labeled proteins were *in vitro* synthesized using the TNT Coupled Reticulocyte Lysate Transcription/Translation kit (Promega) according to the manufacturer's instructions and pRSetB-Myc^{wt}, pRSetB-Myc ^{ΔHBM} , pRSetB-dHCF-N^{wt} or pRSetB-dHCF-N^{PS} as templates. GST-fusion proteins were purified from bacteria according to standard protocols (31; detailed protocol available on request). Equal amounts of bead-coupled GST-fusions were pre-incubated for 2 h in GST Binding Buffer (20 mM Tris-HCl pH 8.0, 200 mM NaCl, 1 mM EDTA, 1 mM DTT, 0.5% NP-40, 10% glycerol, 1% BSA, protease inhibitors), followed by a 2 h incubation at 4°C with ^{35}S -labelled protein, five washes in GST Wash Buffer (20 mM Tris-HCl, 200 mM NaCl, 1 mM EDTA, 1 mM DTT, 0.5% NP-40), analysis by SDS-PAGE (gels were stained with Coomassie Blue to document the amounts of GST-fusion proteins) and autoradiography or exposure to a Phosphorimager screen (Fujifilm FLA-7000).

Immunoprecipitations from S2 cells: 48 hours after transfection, cells were washed once with ice-cold PBS and lysed on ice for 30 minutes in lysis buffer (250 mM NaCl, 50 mM Tris-HCl pH 8.0, 5 mM EDTA pH 8.0, 0.5% Nonidet P-40) containing protease inhibitors (Protease Inhibitor cocktail tablets, Roche). Lysates were centrifuged (10', 13'000 rpm, microfuge) and the supernatants precleared for 1 h at 4°C with protein G Sepharose beads (GE Healthcare), followed by a 3 h incubation with anti-T7 antibodies (0.2 μl) and subsequent 1 hour incubation with protein G Sepharose beads. Beads were washed in Lysis Buffer (3x) and analysed by SDS-PAGE and Western blotting. For the experiment shown in Sup. Fig. 4C, cells were lysed 72 h after transfection and the cleared lysate was incubated for 4 h with 20 μl anti-HA-beads (mouse monoclonal anti-HA-agarose; Sigma), or for 3 h with 200 μl mouse anti-Myc supernatant, followed by a 1 h incubation with protein G sepharose beads.

LacZ assays

Flies were grown under non-crowding conditions; one wandering larva was transferred to an Eppendorf tube and lysed by repeated (3-4x) freezing in liquid nitrogen (for 3-5'), and thawing in a 37° waterbath (for 3-5'), followed by manual homogenization in 100 μl Z-buffer (60 mM Na₂HPO₄, 40 mM NaH₂PO₄, 10 mM KCl, 1 mM MgSO₄). The color reaction was started by mixing the larval lysate with 700 μl Z-buffer (containing 0.3% β -mercaptoethanol) and 160 μl ortho-Nitrophenyl- β -galactoside (0.4% in Z-buffer), incubated for the indicated durations at 30°, and stopped by the addition of 400 μl 1 M Na₂CO₃. Upon 10' centrifugation the supernatant was

Oligonucleotides used for synthesis of dsRNA

Each primer contains a T7 promoter sequence at its 5' end (5'-TAATACGACTCACTATAGGGAGA; not shown below).

Myc protein mutants used for Fig. S4D

The expression plasmids coding for the indicated Myc mutants have been described in Steiger et al. (2008) and Schwinkendorf et al. (2009), except for HA-Myc^C: this protein contains the HA-tag followed by Myc amino acids 1 to 625, i.e. it lacks the C-terminal BHLHZ domain of Myc.

Figure legends

Figure S1. Quantification of dHCF knock-down effects on endogenous Myc targets. S2 cells were incubated with the indicated dsRNAs and RNA isolated 2 d later. Expression levels of the indicated genes were determined by quantitative real-time PCR, using actin 5C as an internal reference. Expression levels in cells treated with *gfp* dsRNA were set to 100 %, and error bars indicate standard deviations.

Figure S2. Knock-down of dHCF *in vivo* does not reduce GAL4 activity. For each time point the average of 3 larvae is shown (\pm standard deviation). Enzymatic activities (calculated from linear regression of the curves shown in the figure) are (* 10^{-3} $\Delta OD_{420}/min$): 0.08 (blank - buffer alone), 0.50 (control - no LacZ-transgene), 6.6 (LacZ1 - no RNAi), 8.1 (LacZ1 + hcf3-RNAi), 8.1 (LacZ1 + hcfV-RNAi).

Supplement "Myc and dHCF"

Figure S3. Knock-down of dHCF *in vivo* impairs (Myc-dependent) growth. Average area of wing imaginal disc clones that have been overexpressing Myc and/or dHCF-dsRNA for 45 h; n=50-80 per genotype; ** indicates p<0.01 as compared to the corresponding control.

Figure S4. Physical interaction between dHCF and Myc *in vitro* and in S2 cells. **A**, *in vitro* translated (IVT) Myc^{WT} preferentially binds to GST-dHCF⁺ (upper panel); GST-dHCF^{PS} was expressed at lower levels in bacteria, so its binding affinity cannot be directly compared to that of GST-dHCF⁺. The lower panel shows a Coomassie Blue staining of the same gel. **B**, *in vitro* translated dHCF⁺ and dHCF^{PS} preferentially bind to GST-Myc^{WT} and GST-Myc^{HBM}. The percentages in panels A and B indicate the relative levels of bound IVT protein, as determined by exposure of the radioactive gels to a PhosphorImager. **C**, anti-HA-epitope antibodies precipitate T7-dHCF when it is co-expressed with HA-Myc, but not when expressed alone. Cells were transfected with T7-dHCF and/or HA-Myc^{WT} (as indicated by a "+" above the lanes) and lysates precipitated with anti-T7 or anti-Myc antibodies. anti-T7-epitope antibodies precipitate HA-Myc^{WT} and HA-Myc^{HBM} when they are co-expressed with T7-dHCF, but not when expressed alone. Labels above the lane indicate the transfected proteins (T7-dHCF and/or HA-Myc^{WT/HBM}). **D**, different Myc mutants still co-immunoprecipitate with dHCF. T7-tagged dHCF was co-expressed in S2 cells with the indicated HA-tagged Myc mutants, followed by cellular lysis and co-immunoprecipitation analysis as described in the main text. The last two lanes contain lysates from untransfected cells (last lane), or from cells expressing HA-Myc^{WT} but no T7-dHCF (penultimate lane).

Figure S5. Efficiency of dHCF and Myc depletion, respectively. S2 cells were treated with the dsRNAs indicated above the lanes, exactly as for the ChIP experiments shown in Figs. 5B, C. Whole cell lysates were probed with the indicated antibodies, revealing efficient depletion of dHCF and Myc, respectively.

Table S2. List of genes that were included in the tissue culture based RNAi screen.
