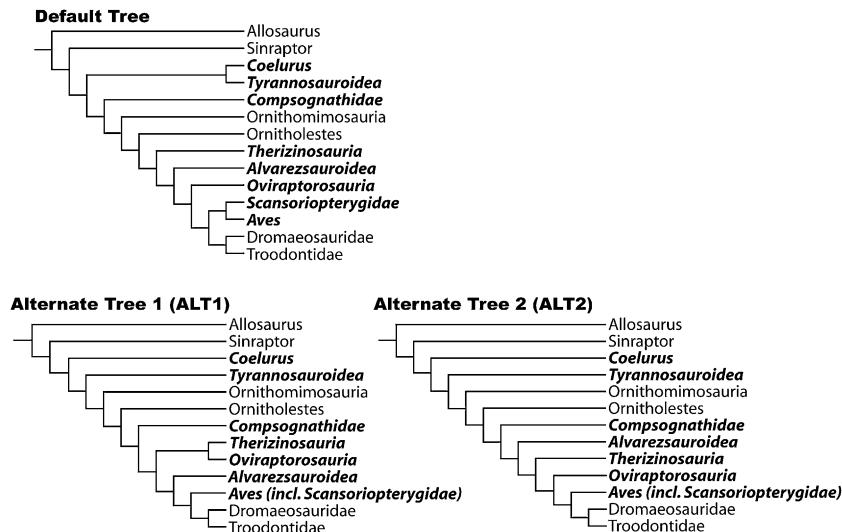

Fig. S1. Alternative tree topologies used to test phylogenetic uncertainty in the relationships between major coelurosaurian subclades in character correlation and ranked trait progression analyses. ALT1 and ALT2 represent the major topologies recovered by (40). The position or composition (Aves) of bold taxa varies between the three topologies. Please see *SI Appendix* for reference list.

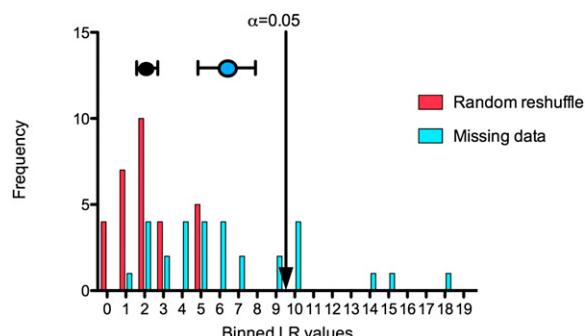

Fig. S2. Histogram summarizing the results of missing data sensitivity tests. Permutations were conducted on Discrete analyses testing for correlation between EEH and a subset of three CHTs. Blue bars represent reanalysis in which missing data for EEH is replaced with randomized data. Red bars represent replicates with all EEH entries randomized (control). Plot shows variation of means between fully random data (black circle) and randomly replaced missing data (blue circle) and the presence of significant LR values despite randomly replaced missing data. Simulations studies indicate that our results are robust and would be expected to withstand the addition of future discoveries, even if future discoveries do not fit the pattern detected here.

Tabulated data on extrinsic evidence of diet in theropod taxa used to generate presence/absence states for the character "extrinsic evidence of herbivory" (EEH) in ecomorphological character correlation analyses. Extrinsic evidence of diet characters as follows: (1) herbaceous gut content: present only; (2) gastric mill: absent/present; (3) evidence of herbivory: present only; (4) evidence of predation—associated tooth marks/embedded teeth: present only; (5) evidence of predation—associated shed teeth at feeding locale or predator/prey combat: present only; (6) associated coprolite containing processed bone: present only; (7) vertebrate gut content: present only; (8) evidence of carnivory: present only; and (9) EEH: absent/present. Character 3 coded as present if characters 1 or 2 present. Character 8 coded as present if characters 4, 5, 6, or 7 present. Character 9 (EEH) coded as absent if character 8 present, and coded as present if character 3 present. Species were coded as gastroliths absent if a near-to-complete articulated skeleton with intact abdominal region lacking gastroliths is known. Please see [SI Appendix](#) for reference list.

Table S2. Chronostratigraphic age estimates for theropod species used to generate branch lengths in character correlation and rank concordance analyses

Estimated maximum and minimum number of ecomorphological traits exhibiting maximal congruence with EEH in theropod dinosaurs (correlated herbivorous traits—CHTs) for theropod species used in character correlation and rank concordance analyses. Numbers in parentheses indicate number of confirmed CHTs recorded for each species. Minimum estimate given as actual number of CHTs plus number of CHTs reconstructed as unequivocally state 1 using maximum parsimony ancestral state reconstructions in Mesquite v. 2.72 (80). Maximum estimate given as minimum number of CHTs plus all possible equivocal CHTs reconstructed using the same optimization technique. Data used to generate quantitative interpretations of herbivory in Fig. 2. Please see *SI Appendix* for reference list.

First-order correlation results between PHTs and EEH (character 4) for the concentrated changes test iterations, pairwise comparisons, and Discrete. LR and P values reported for Discrete. Lowest P value reported for pairwise comparisons. LR >3 indicates positive correlation for Discrete. Values in parentheses reported for pairwise comparisons are the total number of pairs available for testing/the number of those pairs indicating a correlative relationship between EEH and listed PHT. Values <5 in which all pairs show a correlation are listed as not applicable (N/A) as the test cannot detect significance below this threshold. Values <5 in which there is contradiction among pairings listed as not significant (NS). EEH, extrinsic evidence of herbivory; PHT, putative herbivorous trait; DEL, Deltran optimization; ACT, Actran optimization; LR, likelihood ratio.

*Significant at 5%, or LR value >3.

**Significant at 1%, or LR value >5.

Table S5. First-order correlation results for concentrated changes tests with alternate topologies

PHT	Concentrated changes test (EEH independent variable) P value				AT1	AT2

First-order correlation results between PHTs and EEH (character 4) using concentrated changes tests. EEH, extrinsic evidence of herbivory; PHT, putative herbivorous trait; DEL, Deltran optimization; ACT, Actran optimization; AT1, alternate topology one; AT2, alternate topology two.

*Significant at 5%.

**Significant at 1%.

Table S6. First-order correlation results for Discrete with alternate topologies

PHT	Default topology, LR	P value	AT1, LR	P value	AT2, LR	P value
(5) Dentary sym downturned, rostral gap between mandibles	11.0134**	<0.05*	10.058058	<0.05*	10.060264	<0.05*

(31) Cer verts >0	2.7734		2.764518		2.694848	

First-order correlation results between PHTs and EEH (character 4) using Discrete. LR and P values reported.

*Significant at 5%.

**Significant at 1%.

Table S7. Twenty-one PHTs correlating with extrinsic evidence of herbivory (CHTs)

First-order CHTs	Second-order CHTs
5.1 Dentary symphyseal region downturned creating rostral mandibular gap	8.1 Rostral dentary exhibits tooth loss*
6.1 Cranioventral margin of dentary ventrally concave	16.1 Premaxillary teeth elongate relative to maxillary dentition
7.1 Dentary exhibits tooth loss	17.1 Premaxilla edentulous*
9.1 Caudal dentary exhibits tooth loss	18.1 Premaxillary teeth unserrated*
11.1 Dentary symphysis rostrally projecting	19.1 Mandibles lack pronounced replacement waves between teeth*
13.1 Rostralmost dentary teeth conical	20.1 Cheek tooth shape lanceolate
14.1 Premaxillary teeth conical or subconical	23.1 Dentition heterodont*
15.1 Rostral teeth (premaxillary or dentary) conical to subconical	25.1 Premaxillary teeth procumbent
21.1 Teeth symmetrical	26.1 Dentition densely packed*
22.1 Ziphodonty lost	27.1 Mandibular joint ventrally displaced (subhorizontal with ventral margin of dentary)
	31.1 Cervical vertebrae number >10

Ecomorphological traits exhibiting maximal congruence with EEH in theropod dinosaurs (CHTs).

*Traits with enough pairs to be analyzed and detected as significant by pairwise comparisons.
