SUPPLEMENTARY MATERIAL

Figure S1: A maximum likelihood tree of the 39 ribosomal proteins L31 sharing one protein family at T₆₀.

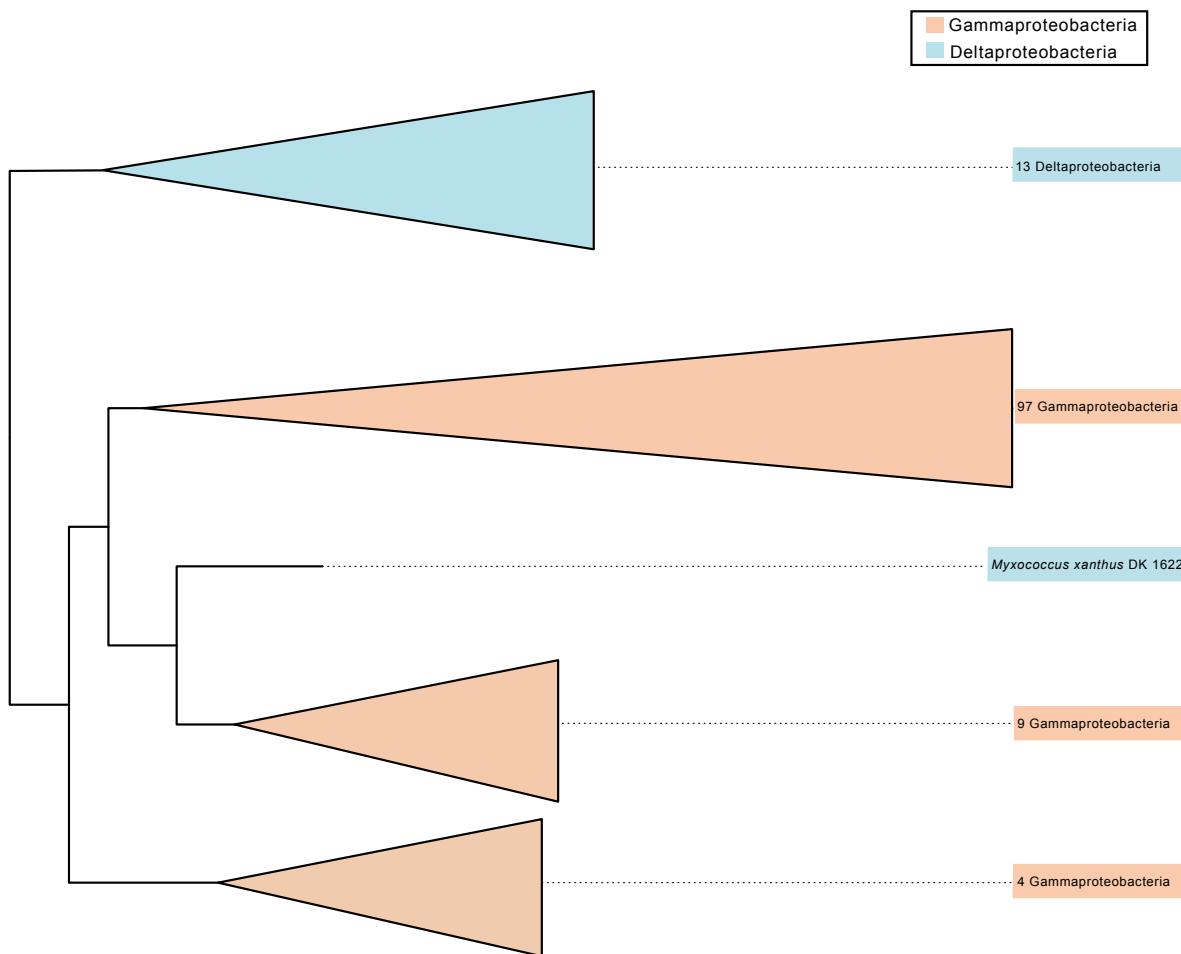

Including 12 Betaproteobacteria (magenta), 20 Gammaproteobacteria (yellow), 6 Deltaproteobacteria (cyan) and the unclassified proteobacteria Magnetococcus MC-1. Clades containing more than one species of the same proteobacterial class are shown collapsed.

SUPPLEMENTARY MATERIAL

Figure S2: A maximum likelihood tree of the 124 asparaginyl-tRNA synthetase proteins sharing one proteine family at T₅₅.

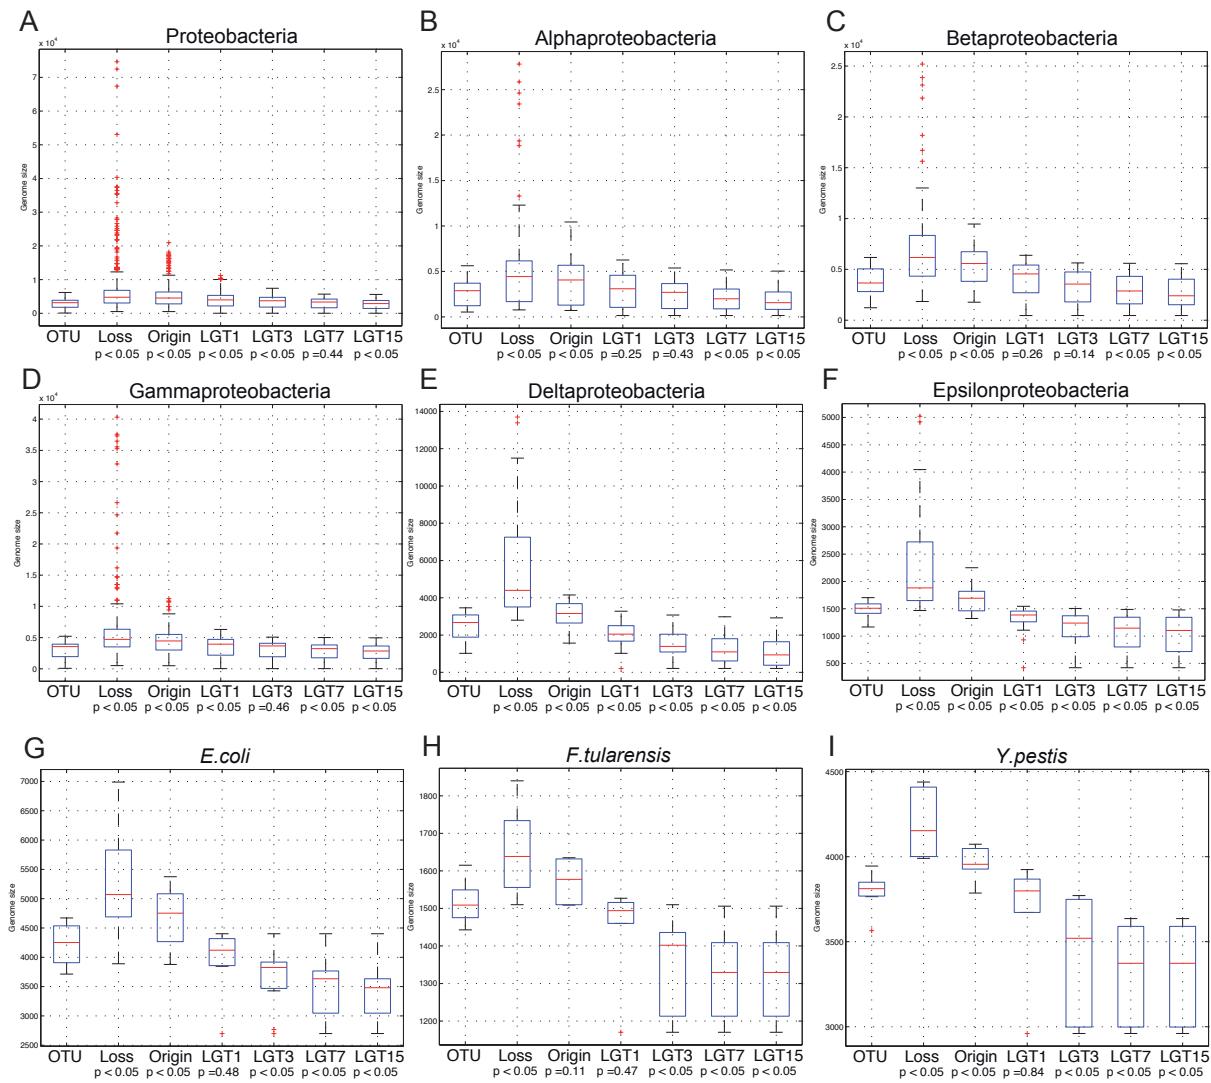

Including 110 Gammaproteobacteria (yellow) and 14 Deltaproteobacteria (cyan). Clades containing more than one species of the same proteobacterial class are shown collapsed.

SUPPLEMENTARY MATERIAL

Figure S3: Boxplots of the ancestral genome sizes calculated with the rRNA reference tree.

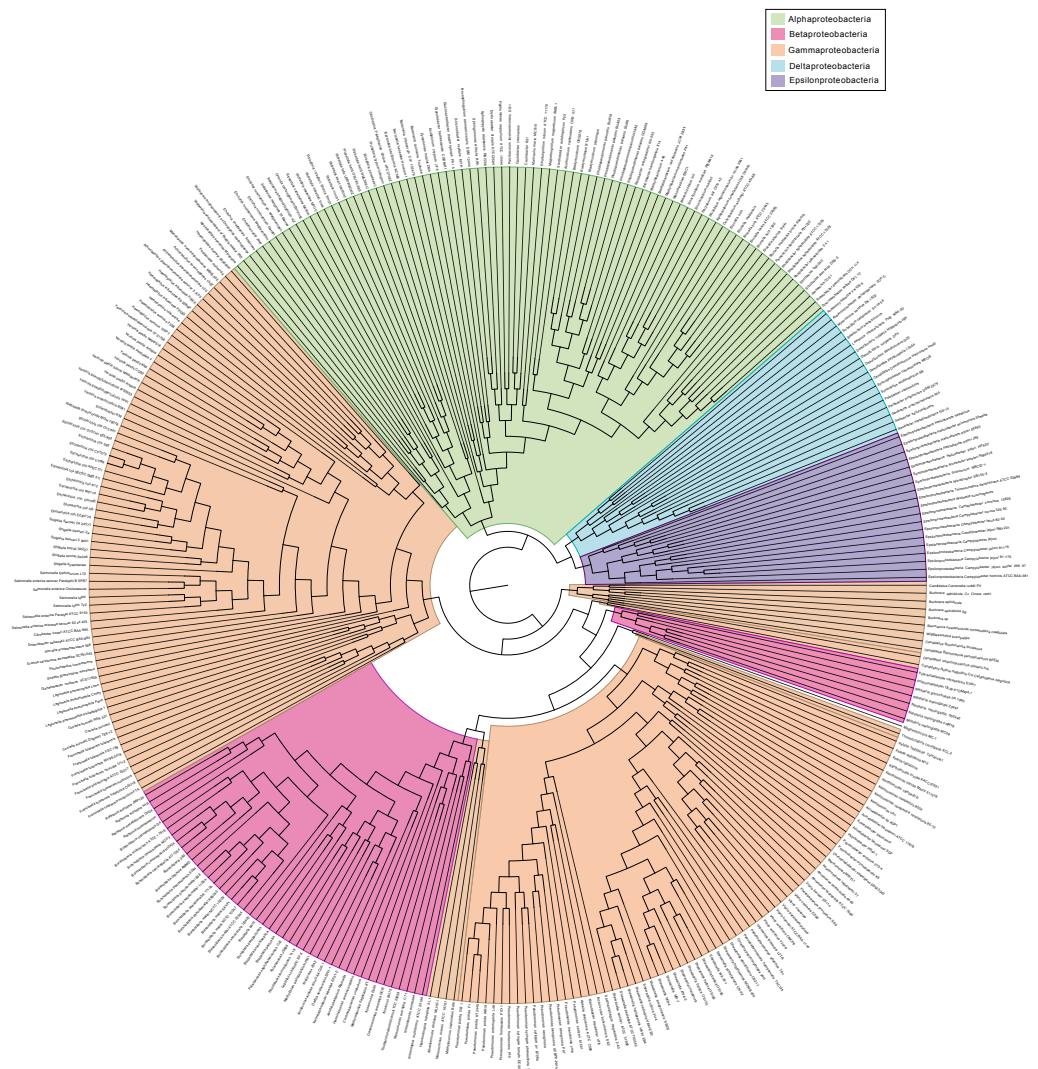

Calculated for the whole Dataset (A), the five proteobacterial classes (B-F) and the tree species *E. coli* (G), *F. tularensis* (H) and *Y. pestis* (I) allowing different amounts of LGT.

SUPPLEMENTARY MATERIAL

Figure S4: Gene content reference tree of 329 proteobacterial species.

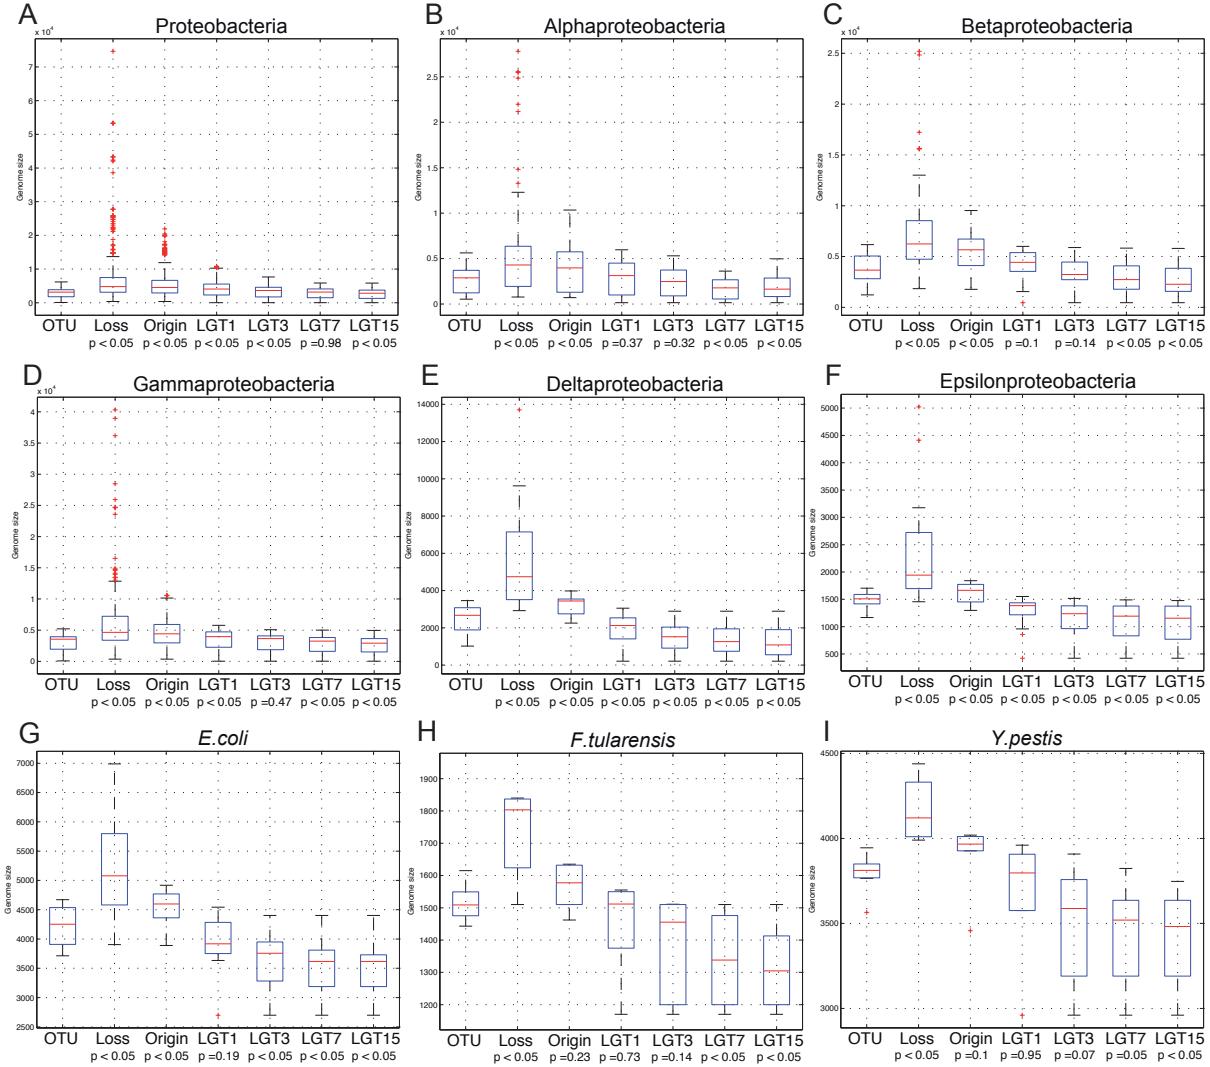

Containing 82 alphaproteobacteria (green), 52 betaproteobacteria (magenta), 157 gammaproteobacteria (yellow), 18 deltaproteobacteria (cyan), 19 epsilonproteobacteria (purple) and the unclassified proteobacteria *Magnetococcus* MC-1.

SUPPLEMENTARY MATERIAL

Figure S5: Boxplots of the ancestral genome sizes calculated with the gene content reference tree.

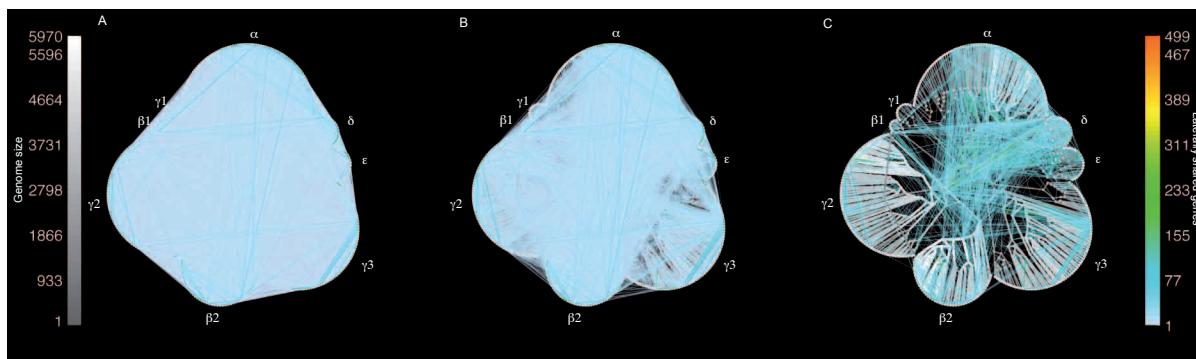

Calculated for the whole Dataset (A), the five proteobacterial classes (B-F) and the three species *E. coli* (G), *F. tularensis* (H) and *Y. pestis* (I) allowing different amounts of LGT.

SUPPLEMENTARY MATERIAL

Figure S6: A minimal LGT network for 329 Proteobacteria using a gene content reference tree.

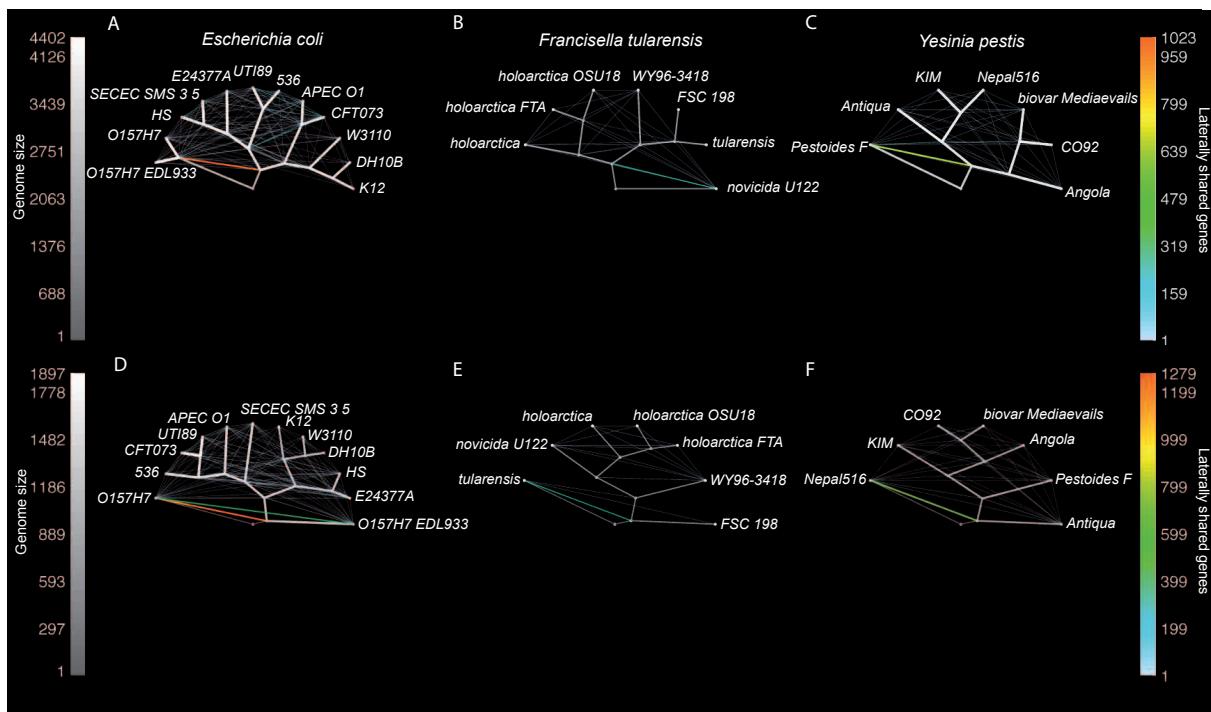

Vertical edges are indicated in gray, with both the width and the shading of the edge shown proportional to the number of inferred vertically inherited genes along the edge (see scale bar). The lateral network is indicated by edges that do not map onto the vertical component, with number of genes per edge indicated in color (see scale). The MLN showing all 61,964 edges of weight ≥ 1 gene in the MLN (A). The MLN showing only the 16,349 edges of weight ≥ 5 genes (B). The network showing only the 3,000 edges of weight ≥ 20 genes (C).

SUPPLEMENTARY MATERIAL

Figure S7: MLN for species datasets.

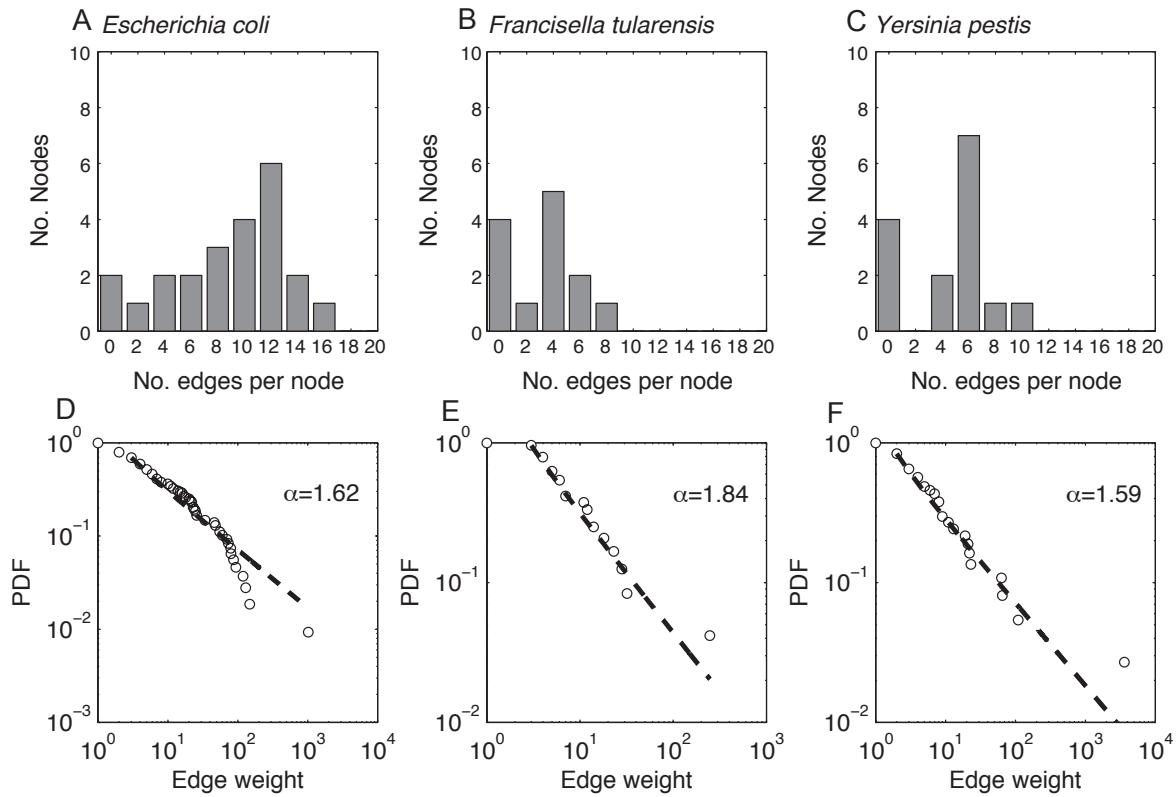

A minimal LGT network for the proteobacterial species *Escherichia coli* (**A**), *Francisella tularensis* (**B**) and *Yersinia pestis* (**C**) using a ML-reference tree and a minimal LGT network for the same species using a gene content reference tree (**D-F**). Vertical edges are indicated in gray, with both the width and the shading of the edge shown proportional to the number of inferred vertically inherited genes along the edge (see scale bar). The lateral network is indicated by edges that do not map onto the vertical component, with number of genes per edge indicated in color (see scale bar).

SUPPLEMENTARY MATERIAL

Figure S8. Properties of the minimal LGT networks in species scale.

Properties are shown for a randomly selected replicate. **(A-C)** Distribution of connectivity, the number of one-edge-distanced neighbors for each vertex, in the MLN. **(D-F)** Frequency distribution of edge weight in the lateral component of the MLN.
