<sup>§</sup> Measured on days 3, 7, 14, 21, and 28 p.v. in whole blood using quantitative real-time polymerase chain reaction (qRT-PCR) as described previously [17].

<sup>¶</sup> Percentage of mice with VV genome copy numbers above the Lower Limit of Quantification (LLOQ) =  $3.5 \times 10^3$  genome copies/ml.

<sup>‡</sup> Numbers shown for each mouse (M) in the group (n = 4 or 5) if above the LLOQ; N/A: Not available since n = 4.

<sup>a</sup> Vaccine/vehicle vs. vaccine/ST-246 comparison using Student's *t*-test on log-transformed data. Extrapolated values were used for those below the LLOQ.

*P*-value <0.050 is considered statistically significant.

<sup>T</sup> The two experiments were performed at different times but were set up in a similar manner.

\* Only day 7 data is shown for all of the above groups since all values were below LLOQ on days 3, 14, 21, and 28 p.v.
