

Figure S1. Schematic overview of OneSTrEP-tagged lamin constructs. Lamin A, C and progerin were tagged at their N-terminus by a OneSTrEP-tag, consisting of two Strep-tag II epitopes (underlined), which interact with high affinity to Streptactin matrix, separated by a serine and alanine linker region. The chemical structure of a Strep-tag II epitope is further depicted. Mature OneSTrEP-tagged lamin A (OST-A) is released after farnesylation of the C-terminal Caax-motif, cleavage of the -aax amino acids and subsequent carboxymethylation of the C-terminus, followed by an upstream cleavage by Zmpste24 in mice cells (indicated by scissor; Face-1 for human cell lines). Due to a loss of 50 amino acids (indicated as Δ50 aa.), including the Zmpste24 restriction site, OneSTrEP-tagged progerin (OST-P) is only processed by farnesylation of the C-terminal Caax-motif, subsequent cleavage of the -aax amino acids and carboxymethylation of the C-terminus, and cannot be further cleaved by Zmpste24. OneSTrEP-tagged lamin C (OST-C), contains a Lamin C-specific terminus, as well as the A-type lamins common coiled-coil rod domain and nuclear localization signal (NLS).

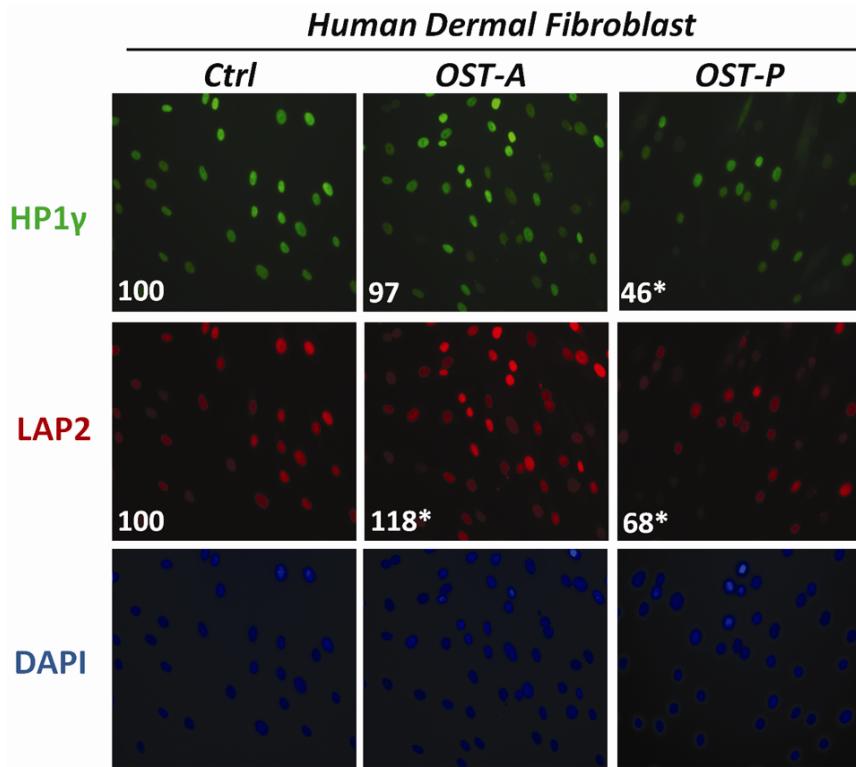

Figure S2. Progerin dependent loss of HP1 γ and LAP2 protein. Fluorescent detection of HP1 γ , LAP2 and DNA (DAPI) in human dermal fibroblasts (HDF) expressing an empty vector, OST-A or OST-P at endogenous lamin A levels. The nuclear intensity of total LAP2 (all isoforms included) and HP1 γ was determined as described in the Material and Methods, and average expression values are depicted in numbers. Distribution curves were tested to be different or comparable using a Kolmogorov-Smirnov statistical test. An asterisk indicates a significant ($p<0.01$) difference between HDFs expressing OST-A or OST-P in comparison to empty vector (Ctrl) infected HDFs. The following antibodies were used: α -HP1 γ , mab3450, Chemicon, Temecula, USA ; α -LAP2, kind gift from K. Wilson, raised against residues 1-187 of human LAP2, and suitable for detection of all LAP2 isoforms).

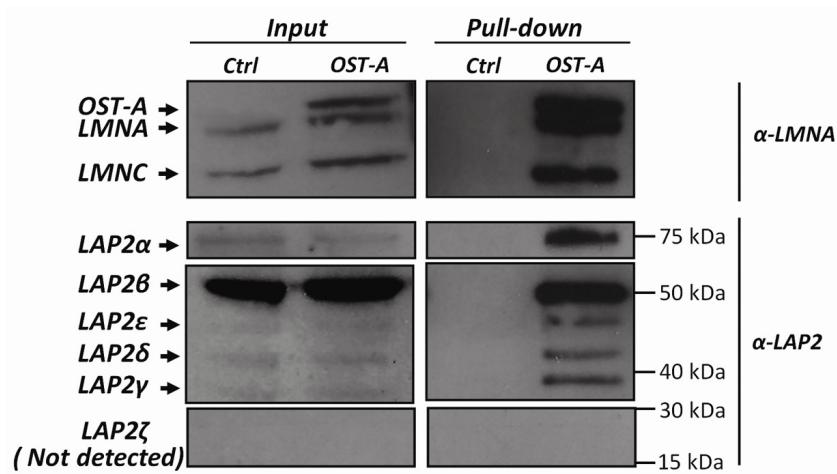

Figure S3. Interactions between Lamin A and LAP2 isoforms. Western blot of a OneSTrEP pull-down performed on U2OS cells infected with OST-A and control virus. Input and pull-down fractions were immunoblotted with α -LaminA/C (Sc6215, Goat, Santa Cruz; detects endogenous Lamin A and C as well as OST-A) and α -LAP2 (Y-20, Sc19783, Goat, Santa Cruz; suitable for LAP2 $\alpha,\beta,\gamma,\delta,\epsilon$ and ζ detection). With the exception of LAP2 ζ , which could not be detected, all other isoforms were immunooblotted at their respective molecular weights.

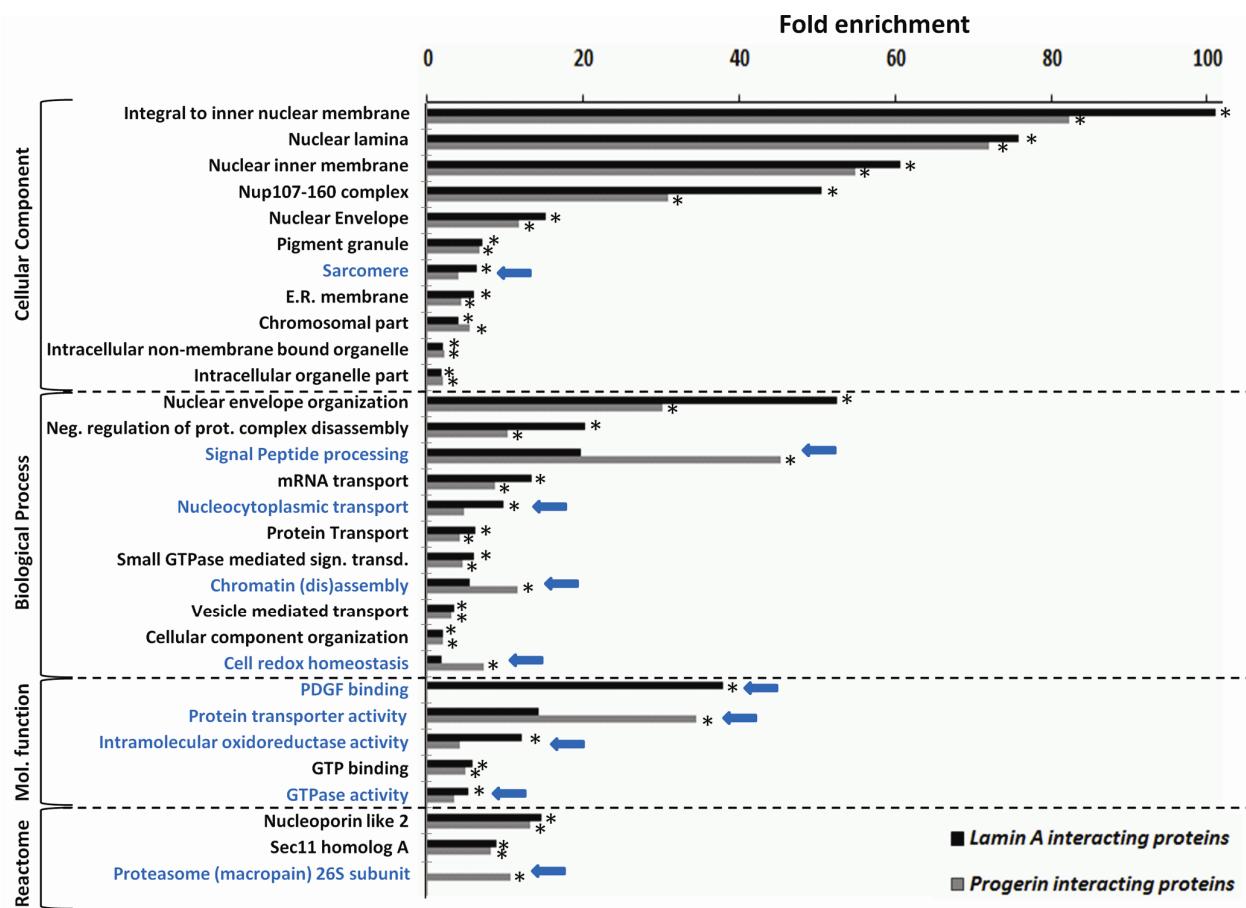

Figure S4. GO analysis of lamin A and progerin interacting proteins identified in MEFs.

Identified lamin A and progerin interacting proteins were analyzed separately for the GO categories “cellular components” (CC), “biological process” (BP), “molecular function” (MF), as well as the reactome (R) database. Significant categories were determined by standard statistical algorithms incorporated into the DAVID database (see Material & Methods) and are indicated by asterisks ($p < 1 \times 10^{-3}$; random proteins used as background). Categories enriched for by either OST-A or OST-P are indicated by arrows.

Table S1. Mass spectrometry data for identified lamin A interacting proteins in NklITAg cells.

Mascot scores for identified lamin A interacting proteins in NklITAg cells are listed. Furthermore it is indicated whether identified lamin A interactors were identified in two previous NE proteome studies (see grey shaded column) which had identified proteins in an INM/lumen/ONM⁶ fraction or an INM/lamina/nucleoplasmic fraction¹⁰. Hashes indicate proteins GO-annotated as 'Extracellular region'.

Table S2. GO analysis for identified lamin A (NklITAg) and preferential lamin A/progerin (MEF) interactors. Identified lamin A interacting proteins in NklITAg cells and preferential lamin A/progerin interactors in MEFs, were analyzed separately for the GO categories “cellular components” (GO-CC), “biological process” (GO-BP), “molecular function” (GO-MF), as well as the Reactome (R) database. Categories are listed, together with the amount of proteins represented in the category compared to the total amount of annotated proteins. Enrichment factors are determined in comparison to random protein sets as well as NE proteins^{6,10}, and p-values are indicated ($p<1\times 10^{-3}$ indicated in bold) based on statistical algorithms incorporated into the DAVID database.^{22,23-71}

Table S3. GO analysis for identified lamin A and progerin interacting proteins in MEFs.

Identified lamin A and progerin interacting proteins in MEFs, as well as previously identified NE proteins were analyzed separately for the GO categories “cellular components” (GO-CC), “biological process” (GO-BP), “molecular function” (GO-MF), as well as the reactome (R) database.²² Categories are listed together with the amount of proteins represented in the category versus to the total amount of annotated proteins, the enrichment factor compared to random protein sets and significance level. Significance p-values ($p < 1 \times 10^{-3}$; statistic testing includes kappa statistic measurement and is further described elsewhere) are indicated in bold; non-significant values are underlined or blank in case no proteins was found within the respective GO-term.

Table S4. Mass spectrometry data for identified lamin A and progerin interacting proteins in MEFs. Mascot scores for identified lamin A and progerin interacting proteins in MEF+/+ and MEF-/ cell lines are listed. Interactors are categorized into interactors of lamin A, progerin or both. As many of the identified lamin A interactors were also detected at mascot scores just below inclusion criteria in progerin pull-down samples and vice versa, we used additional criteria (See material and methods) to identify preferential interactors. For selected preferential interactors it is indicated whether they were identified in two previous NE proteome studies (see grey shaded column) which had identified proteins in an INM/lumen/ONM⁶ fraction or an INM/lamina/nucleoplasmic fraction¹⁰. Asterisk and hashes respectively indicate proteins localized to the ER lumen and extracellular regions.
