## SUPPLEMENTAL FIGURES

**Figure S1. Representation of Spearman Rank Correlations between Data Sources upon Prioritization, Here Using the Vascularisation Training Set**

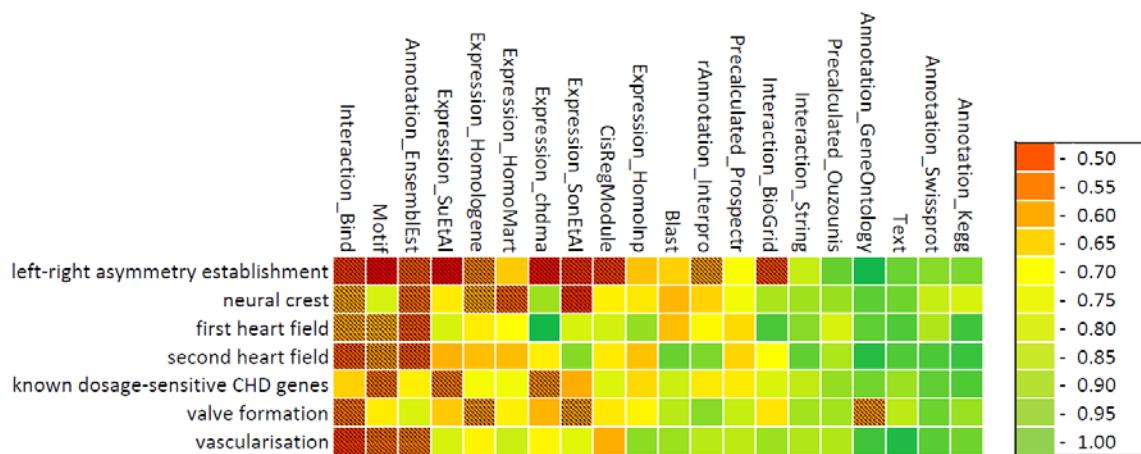

The Cis-regulatory modules (Cr) data source is not strongly correlated with any other source, while the Textmining (Te) and the Gene Ontology (Go) data source, or both micro-array expression analysis data sources for adult human tissues (Sy and So) are strongly correlated. All data sources are perfectly correlated with themselves.

**Figure S2. Performance of the Different Data Sources for Prioritization as Assessed by Leave-One-Out Cross-Validations (LOOCV)**

Performance measures displayed are the area under the ROC curve of the LOOCV (specificity/sensitivity plot). Performance of the data source in prioritizations depends on the training set. For example: the chdma (microarray expression data for heart development) is highly informative for first heart field and the neural crest cells, but performs poorly for the other training sets. Similarly, Gene Ontology does not contain information to significantly prioritize genes involved in valve formation, while it does contribute to prioritizations according to the other training sets. Information on the standard data sources can be found on the [Endeavour website](#), other data sources are as described in the main text. Similar LOOCV results have been used to decide which data sources were excluded from prioritization (LOOCV <0.6; striped boxes).

**Figure S4. Mapping of Translocation Breakpoints of Family N**

**(A)** Breakpoint on chromosome 2 as determined by two breakpoint spanning fosmid probes, G248P8673B4 and G248P8684C9. This breakpoint is within the POTE ankyrin domain family, member E (POTEE) gene. This gene is variable in copy number as described by the several independent reports in the Database of Genomic Variants. **(B)** Breakpoint on chromosome 6 as determined by the breakpoint spanning fosmid probe G248P8912A2. FISH moreover showed a proximal position of the probes AL031056 and G248P8121B5 and a distal position of the probes RP11-455K21 and G248P82418C3 compared to the breakpoint, thus indicating that the breakpoint lies within a 17 kb region at chromosome position 149,678,240-149,695,219, within the first intron or the promoter region of TAB2.
