SI Materials and Methods

Northern Blot Analysis. A murine tissue mRNA blot (Mouse MTN Blot) containing 2 µg of mRNA from eight different tissues was purchased from Clontech Laboratories, Inc. Human hematopoietic cell line mRNA was extracted using TRIzol (Invitrogen), followed by Oligo-Tex (Takara Bio Inc.), and 4 µg of mRNA from each line was transferred to a nylon membrane. Both filters were hybridized with mouse *hemp* cDNA or a β -actin cDNA probe.

Construction of a Targeting Vector and Generation of *hemp* Knockout Mice.

A BAC clone containing the mouse *hematopoietic expressed mammalian polycomb* (*hemp*) gene was isolated from a mouse genomic BAC library (Genome Systems, Inc.) using a portion of the mouse *hemp* cDNA as a probe. A 12-kb genomic fragment from an ApaI site in intron 2 to an EcoRV site in exon 6, and a 4-kb genomic fragment from a ClaI site in exon 9 to an ApaI site in intron 11 were used as the 5' and 3' arms of the knockout vector, respectively. A fragment containing *IRES/GFP* (derived from *pIRE2-EGFP*; Clontech Laboratories Inc.), an SV40 polyadenylation signal, and a *floxed Neo* resistance gene were inserted between the 5' and 3' arms, and a *diphtheria toxin A* (*DTA*) gene was attached to the 5' end of the vector as a negative selector. ES cells (1×10^5) from E14 (kindly provided by Nobuaki Yoshida, Institute of Medical Science, University of Tokyo, Japan) were electroporated with 30-µg linearized vector and selected with 400 µg/mL of G418. Individual candidate clones were screened by genomic PCR using the following primers: 5' P1 (5'-CAGACTTCAGGTAACGGTACAGAAACCTTC-3') and P2 (5'-AAGACCCTAGGAATGCTCGTCAAGAACGAC-3'), followed by Southern blottings using an external 3' probe. Correctly targeted cells were microinjected into blastocysts derived from C57BL/6xBDF1 mice. Chimeric male mice were crossed with C57BL/6 female mice to transmit the mutant allele to the progeny. The *Neo* resistance gene was removed by microinjecting a *Cre* expression vector into fertilized eggs obtained from crossing *hemp* heterozygotes with C57BL/6 mice. Mice that had been backcrossed to the C57BL/6-Ly5.2 background at least seven times were used for these studies. All mice were maintained according to the guidelines of the Institute of Laboratory Animal Science, Hiroshima University.

Generation of an Anti-Hemp Antibody, Immunoprecipitation, and Western Blot Analysis. A 5' segment of mouse *hemp* cDNA, corresponding to amino acids 5 to 91 of the protein product, was amplified using the following primers: 5'-GACGGATCCGATAGCTGCAGT-3' and 5'-CCAGAATTCTGCCTTCTTA-3', where the underlined nucleotides were substituted to create restriction-enzyme sites. The PCR product was subcloned into the bacterial expression vector, *pGEX1* (Amersham Pharmacia). Recombinant protein was purified using an anti-GST column and used to immunize rabbits to generate a polyclonal antibody against the N-terminal region of mouse Hemp (HempN). To detect Hemp protein, aliquots of ~1 mg of protein were incubated with the HempN antibody (1:400) coupled to Protein A. Then, the immunoprecipitated protein was separated by 7.5% SDS/PAGE, transferred to a polyvinylidene membrane, and blotted with the same antibody (1:3,000). Signals were detected using the ECL chemiluminescent system (Amersham).

Skeletal Analysis. Skeletal analysis was performed essentially as previously described (1). In brief, mouse embryos were fixed in 95% ethanol, defatted in acetone, and subjected to staining with

Alizarin red S for bone and Alcian blue for cartilage. The stained specimens were cleared with 1% KOH and stored in glycerol.

Quantitative Real-Time PCR. Quantitative real-time PCR was performed as previously described (2). PCR primers for murine *hemp* were purchased from Takara Bio Inc.

Immunohistochemical Analysis. Preparation of sagittal sections of the embryos and immunohistochemical staining were performed as previously described using the HempN antibody (1:50) (3).

Flow Cytometric Analysis. Flow cytometric analysis was performed essentially as previously described (4). Monoclonal antibodies (mAbs) used in this study are: anti-CD4-PE, anti-CD4-allophycocyanin (RM4-5), anti-CD8-PE (53-6.7), anti-CD3-PE (145-2C11), anti-CD25-allophycocyanin (PC61), anti-c-Kit-allophycocyanin (2B8), anti-B220-PE (RA3-6B2), anti-Mac1-PE (M1/70), anti-Gr1-allophycocyanin (RB6-8C5), anti-Ter-119-PE, anti-CD45.1-PE (A20), anti-CD45.2-FITC (104), anti-CD32/CD16 (2.4G2) (to block Fc receptors).

CFU-C, HPP-CFC, and Competitive Repopulation Assays. Sorted CD150+ LSK cells from FL were cultured in MethoCult GF3434 (StemCell Technologies Inc.) and colonies were counted on day 8 (CFU-C) or day 16 (HPP-CFC). For the competitive repopulation assay, sorted CD150+ LSK cells from E14.5 FL (Ly5.2) were transplanted into irradiated (9.5 Gy) Ly5.1 recipients together with Ly5.1 bone marrow mononuclear cells. Peripheral blood and bone marrow chimerisms were analyzed as previously described (5).

Cell Cycle and Apoptosis Assays. The short-term BrdU incorporation assay with sorted cells was performed as previously described (2). To detect apoptotic cells, sorted cells were attached to glass slides, fixed, stained with anticleaved caspase-3 antibody (Cell Signaling Technology Inc.), and visualized using a fluorophore-conjugated secondary antibody and DAPI counterstain. Apoptotic cleaved caspase-3-positive cells were analyzed and counted using a confocal microscope.

DNA Microarray Analysis, Microarray Scanning, and Data Processing. Total RNA was isolated using TRIzol reagent (Invitrogen) from lineage (lin)⁻/c-kit^{high} cells isolated from E12.5 *hemp*^{+/+} and *hemp*^{-/-} fetal livers using TRIzol reagent (Invitrogen). The amplification and preparation of amino allyl RNA (aRNA) and the labeling of aRNA with the fluorescence dyes, Cy3 and Cy5, were performed with the Amino Allyl MessageAmp II aRNA Amplification Kit (Ambion Inc.). The Cy3- or Cy5-labeled RNAs were hybridized to the probes on the 3D-Genemouse oligo chip 24k (Toray Industries Inc.) according to the manufacturer's instructions.

Microarrays were scanned using a ScanArray Lite Scanner (Perkin-Elmer) and the photomultiplier tube levels were adjusted to achieve 0.1% to 0.5% pixel saturation. Each tagged-image file-format image was analyzed using GenePix Pro-6.0 (Molecular Devices). Data were filtered to remove low-confidence measurements, and the data were globally normalized per array such that the median log₂ (Cy3/Cy5 fluorescence ratio) was 0 after normalization. Results were further processed for Gene Ontology term enrichment using PathwayStudio6 software (Arriadne Genomics Inc.). Genes with global normalization scores greater than 50 in either *hemp*^{+/+} or *hemp*^{-/-} samples, and that differed by more than 1.5-fold between samples, were classified into "Biological process" and "Molecular function" categories. Those genes whose expression levels that differed by more than twofold were characterized by MultiExperiment Viewer version 4.3.02 software (<http://www.tm4.org/mev.html>).

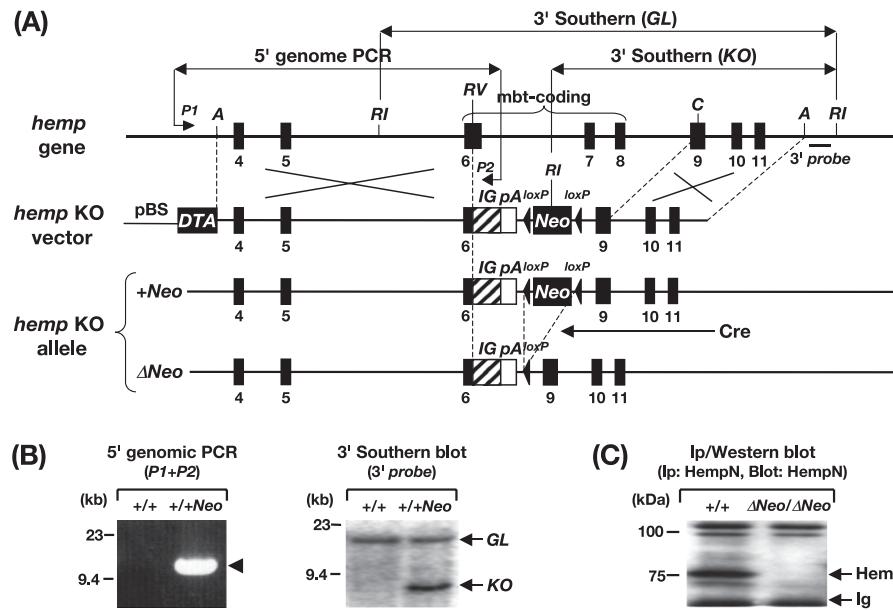

Fig. S1. Generation of *hemp*-deficient mice. (A) Targeting strategy. A genomic region encompassing exons 6 to 8 was replaced with *IRES/GFP* (*IG*), with *polyA* (*pA*), and floxed *Neo*-resistance gene, and the *Neo*-resistance cassette was removed by Cre recombinase. The positions of *P1* and *P2* primers for genomic PCR and a 3' probe for Southern blot are shown. Restriction sites: *A*, Apal; *RI*, EcoRI; *RV*, EcoRV; *C*, Clal. (B) A 5' genomic PCR and 3' Southern blot to detect homologous recombination. Recombination-specific PCR product is indicated by an arrowhead (Left) and germline (GL) and knockout (KO) allele-derived bands are indicated by arrows (Right). (C) Absence of Hemp protein in *hemp*^{−/−} mice. The positions of Hemp protein and Ig are indicated by arrows.

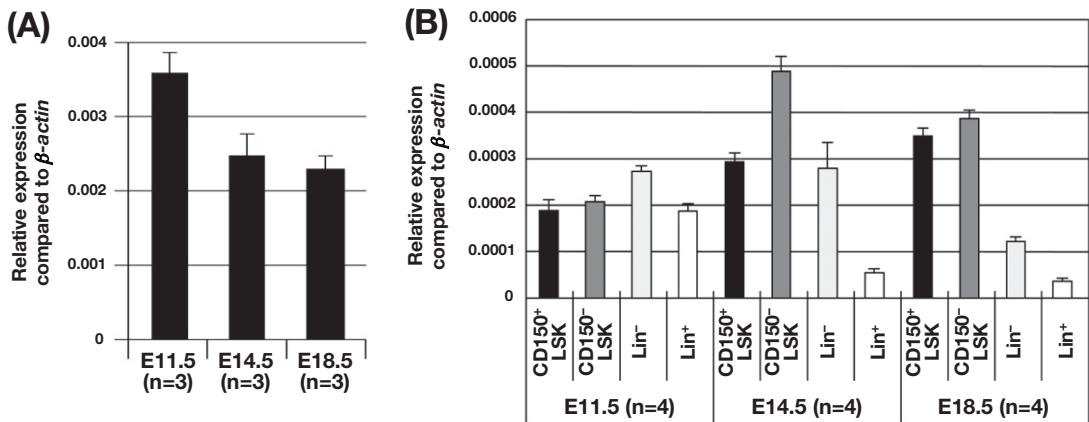

Fig. S2. Expression patterns of *hemp* in hematopoietic compartments of developing FLs. (A) Quantitative PCR analysis of *hemp* expression in E11.5, E14.5 and E18.5 FLs. Expression levels of *hemp* are shown as the ratio of *hemp* relative to *β-actin* (data \pm SD). (B) Quantitative PCR analysis of *hemp* expression in CD150⁺ LSK, CD150⁻ LSK, Lin⁻ and Lin⁺ fractions of E11.5, E14.5, and E18.5 FLs. Expression levels of *hemp* are shown as the ratio of *hemp* relative to *β-actin* (data \pm SD).

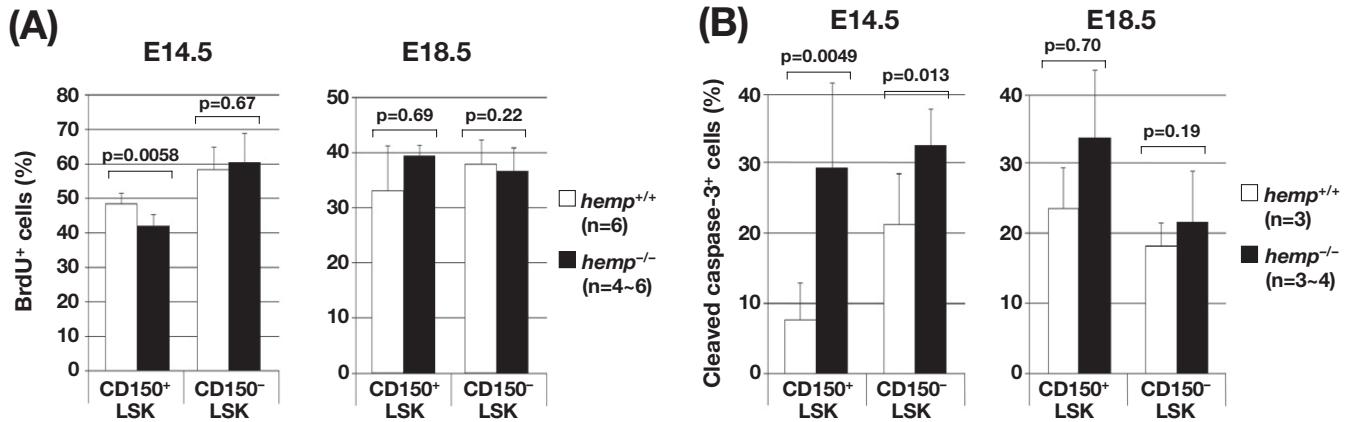

Fig. S3. Proliferative and apoptotic assays of *hemp*^{+/+} and *hemp*^{-/-} FL cells. (A) Quantification of short-term BrdU and incorporation in *hemp*^{+/+} (open bar) and *hemp*^{-/-} (closed bar) CD150⁺ and CD150⁻ LSK cells from E14.5 and E18.5 FLs. Cells were isolated after 90 min in vivo BrdU-labeling, stained with an anti-BrdU antibody, and analyzed by fluorescent microscopy. Frequencies of BrdU-positive cells were quantified (data ± SD). (B) Quantification of cleaved-caspase-3-positive cells in *hemp*^{+/+} (open bar) and *hemp*^{-/-} (closed bar) CD150⁺ and CD150⁻ LSK cells from E14.5 and E18.5 FLs. Cells were stained with an anti-cleaved caspase-3 antibody, analyzed by fluorescent microscopy, and the frequencies of cleaved caspase-3-positive cells were quantified (data ± SD).

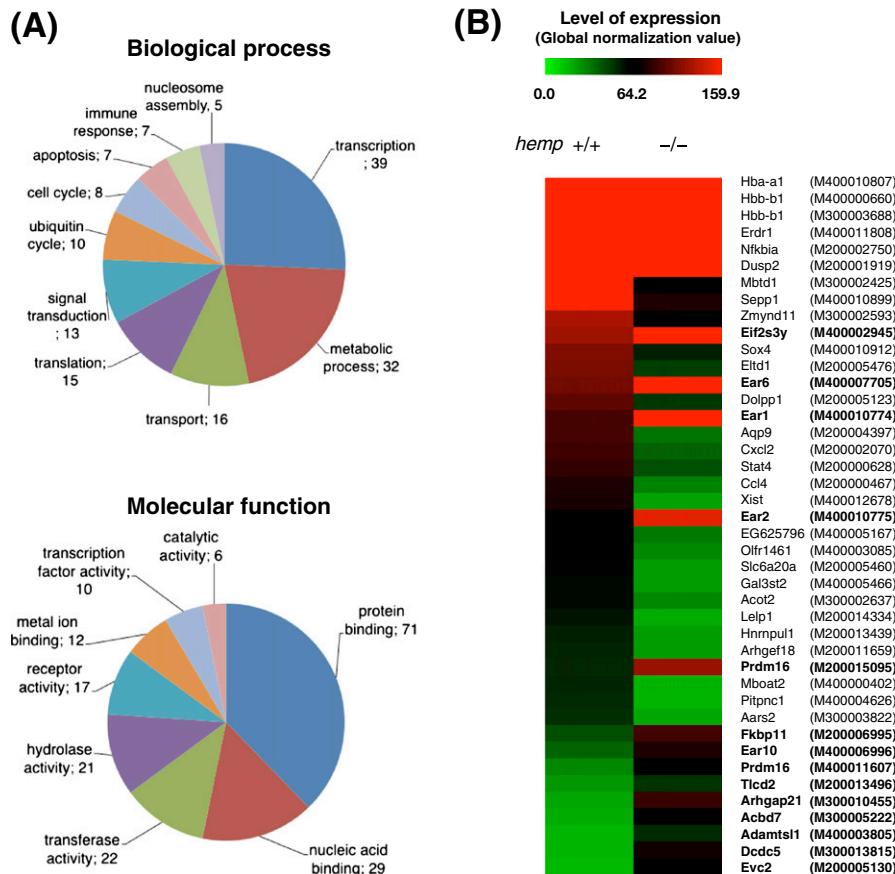

Fig. S4. Analysis of gene expression profiles in lin-/c-kit^{high} cells of E12.5 in *hemp*^{+/+} and *hemp*^{-/-} FLs. (A) The genes whose expression levels were more than 50 in *hemp*^{+/+} or *hemp*^{-/-} arrays and were altered more than 1.5-fold, and were classified into “Biological process” and “Molecular function” categories, according to the Gene Ontology terms. The classifications and gene numbers are shown. (B) Clustering of genes whose expression levels were more than 50 in *hemp*^{+/+} or *hemp*^{-/-} arrays and were altered more than 2.0-fold. Gene names are shown in the right with the probe IDs, and those with more than twofold increase in the expression in *hemp*^{-/-} FL are shown in boldface.

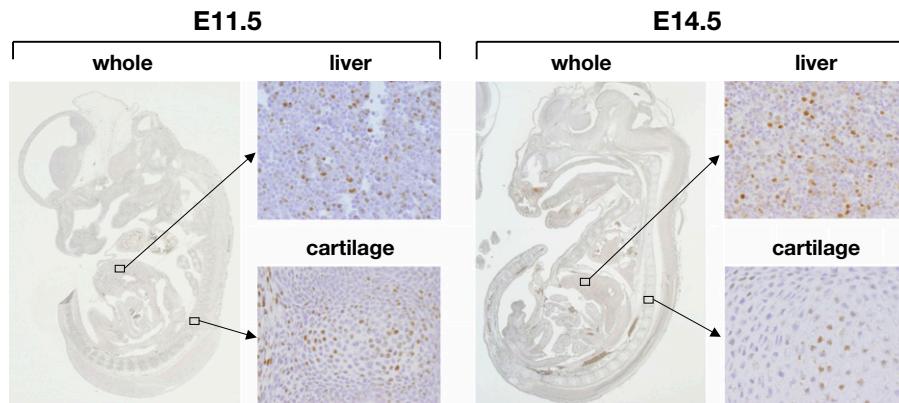

Fig. S5. Immunohistochemical staining for Hemp expression. Sagittal sections of embryos at E11.5 (Left) and E14.5 (Right) were immunohistochemically stained with an anti-Hemp antibody. Staining patterns of the whole embryo are shown in the left panels and those in the boxed areas of the liver and the Q:2 cartilage are magnified in the right panels. Magnification: 50 \times .

Table S1. Number of pups obtained from intercrossing of *hemp*^{+/−} mice

Age	Number of pups	Genotypes		
		+/ ⁺	+/ [−]	-/ [−]
E12.5	53	12	30	11
E17.5	49	14	24	11
P0.5	67 (10)	23 (2)	36 (2)	8 (6)
P1.5	26	10	16	0
P21.5	51	15	36	0

Pups obtained at various ages were subjected to genotyping using tail DNA, and number of pups with each genotype is shown. Number in the parentheses indicates pups that were found dead.

Table S2. Genes with expression levels showing greater than 1.5-fold up-regulation in *hemp*^{-/-} arrays compared with *hemp*^{+/+} arrays
