

Supplemental Data

Figure S1. Clusterin inhibits H₂O₂-induced ROS production in H9c2 cells.

After 2h pre-incubation with 10 µg/ml clusterin, H9c2 cells were treated with different concentration of H₂O₂ (0–400µM) for 2 h. For measuring ROS production, the cells were labeled with DCFH-DA. Quantitative analysis was performed by measuring the fluorescence intensity. Each value represents the mean ± SD of three independent experiments (**P* < 0.05).
