

## Supplemental Data

### Context-Dependent Transformation of Adult

### Pancreatic Cells by Oncogenic K-Ras

Sharon Y. Gidekel Friedlander, Gerald C. Chu, Eric L. Snyder, Nomedra Girnius, Gregory Dibelius, Denise Crowley, Eliza Vasile, Ronald A. DePinho, and Tyler Jacks

#### Supplemental Figures

**Figure S1.** Further characterization of *Pdx1CreER<sup>TM</sup>;LSL-Kras<sup>G12D</sup>* compound mice.

**A-B:** Immunohistochemical staining for the  $\alpha$  cell marker Glucagon (A) and PP cell marker PYY (B). Note positive staining in mPanINs, ductal metaplasia and in non-neoplastic islet (orange, black and red arrows, respectively).

**C-D:** H&E staining of pancreata obtained from mice 120 days after TM injection. Note developed ductal structures in the islets (arrows in C), exocrine hypoplasia, mPanINs (arrows in D), ductal metaplasia (arrowhead in D) and strong stromal reaction.

**E-F:** H&E staining of pancreata derived from mice treated with either TM dissolved in corn oil by intraperitoneal injection (E) or TM dissolved in carboxymethyl cellulose by oral gavage (F). Note peritonitis in E and mPanIN formation in F (arrows).

Bars: A, B: 50  $\mu$ m; C-E: 100 $\mu$ m; F: 200 $\mu$ m.

**Figure S2.** *Kras<sup>G12D</sup>* activation in *pro-CPA*-positive cells of the adult pancreas results in mPanIN and PDAC development at low frequency.

**A:** X-gal staining of a pancreas derived from a TM-treated *proCPA1CreER<sup>T2</sup>;LSL-Kras<sup>G12D</sup>;LSL-LacZ* compound mouse shows mPanIN formation (arrow).

**B:** H&E-stained section of metastatic PDAC (m) in the liver (l) of a *proCPA1CreER<sup>T2</sup>;LSL-Kras<sup>G12D</sup>;Trp53<sup>flox/flox</sup>* compound mouse.

Bars: A: 100  $\mu\text{m}$ ; B: 200 $\mu\text{m}$ .

**Figure S3.**  $Kras^{G12D}$  activation in combination with p53 or Ink4A/Arf loss in *pro-CPA*-positive and *insulin*-positive cells of the adult pancreas results in mPanIN3 and PDAC development after caerulein treatment.

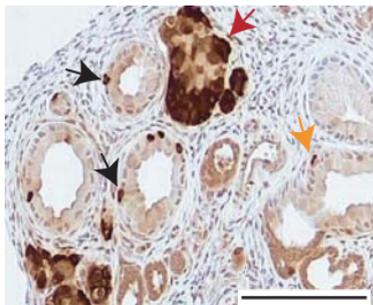

**A-B:** H&E-stained sections of mPanIN3 (arrow in A) and PDAC (B) in caerulein- & TM-treated *proCPA1CreER<sup>T2</sup>;LSL-Kras<sup>G12D</sup>;Trp53<sup>flx/flx</sup>* compound mice.

**C:** H&E-stained section of PDAC invading the spleen (S) of a TM- & caerulein-treated *proCPA1CreER<sup>T2</sup>;LSL-Kras<sup>G12D</sup>;Ink4A/Arf<sup>flx/flx</sup>* compound mouse.

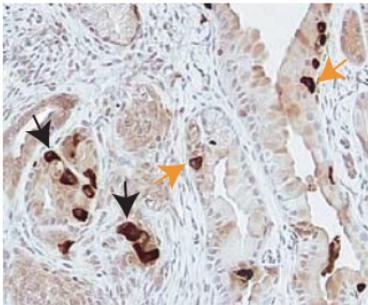

**D:** H&E-stained section of PDAC arising in a caerulein- & TM-treated *RipCreER<sup>TM</sup>;LSL-Kras<sup>G12D</sup>; Trp53<sup>flx/flx</sup>;LSL-LacZ* compound mouse. The tumor exhibits anaplasia with giant cells (arrows).

Bars: 200  $\mu\text{m}$ .

**Table S1: Quantification of the recombination efficiency and specificity of the different Cre strains used in the study. Mice were treated with Tamoxifen (TM) by intraperitoneal injections of 9mg/40g body weight in corn oil, one every other day for a total of 3 injections. Animals were at the age of 21-30 day old at the time of first injection and sacrificed 14 days after the last TM injection. Analysis was performed on X-gal stained sections of pancreata derived from three mice of each genotype.**

Genotype	% Recombined acinar cells per tissue section by analyzed areas	Average % recombination of acinar cells per tissue section	Number of recombined islets/ total number of islets per tissue section	% Recombination per analyzed islet	Average % recombination per islet	Number of recombined ducts/ total number of ducts per tissue section	% Recombination per analyzed duct	Average % recombination per ducts	# of recombined single cells outside the islets per tissue section
