

Supplementary Figures and Legends

Figure S1: Competitive fitness, growth curves, and representative flow cytometry profiles for all 49 long-lived strains examined

Figure S2: Competitive fitness control experiments

- a) Heat map representing the relative fitness of strains initially inoculated with different ratios of WT/mutant by volume. Green indicates relative fitness < 0 (outcompeted by wild type), red indicates relative fitness > 0 . Statistical significance was determined at week 3.
- b) Heat map as in (a) for the random mutants chosen for this study.

Figure S3: Translation mutants have decreased mean cell size

- a) Representative forward scatter graphs for sample strains.
- b) Strains which showed a significant difference in mean cell size from wild type by forward scatter.

Figure S4: Long lived mutants found to be diploid

- a) Representative flow cytometry profiles of log phase SYTOX Green stained yeast.
- b) Replicative lifespans of remade *rpl20b* Δ . The number of mother cells is shown in (), mean lifespan in [].

Figure S5: Long lifespan has negligible fitness benefit. Graph values are from an in silico simulation of a WT mutant (RLS=26) in competition with a mutant with equal doubling time but much greater lifespan (RLS=52)

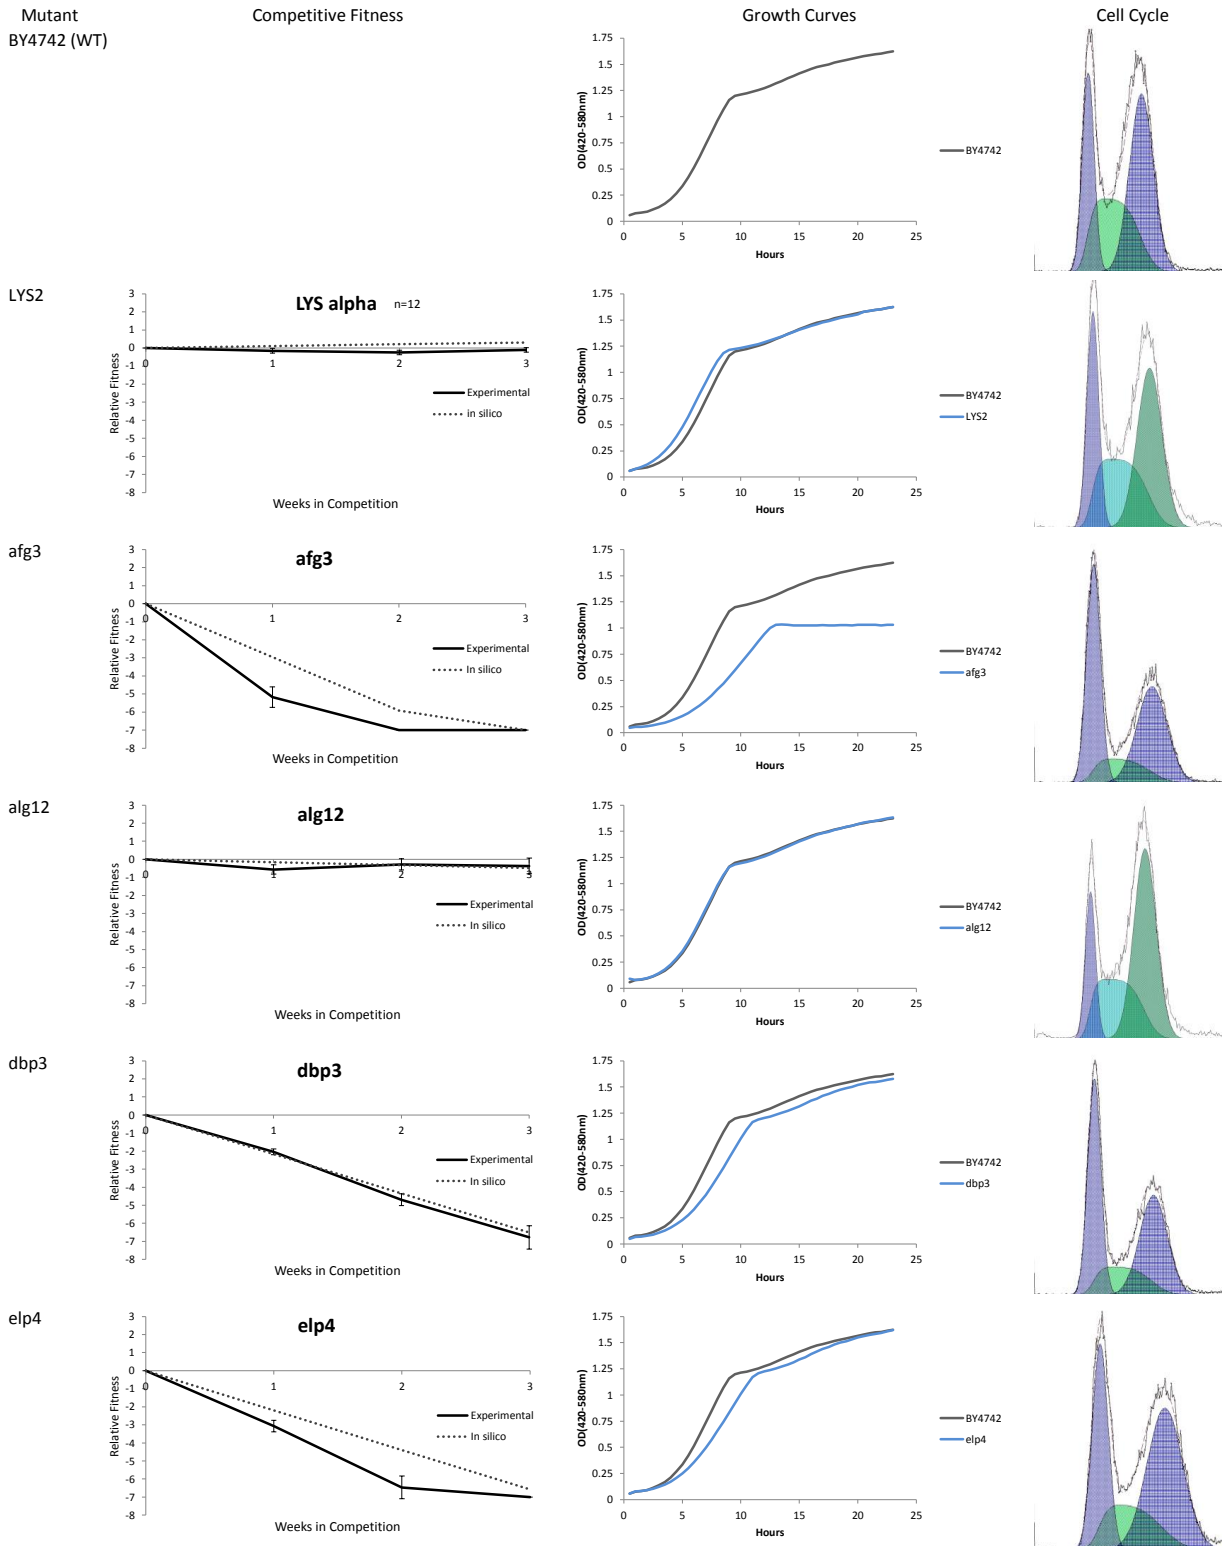

Figure S6: Heat map representing the relative fitness of all strains tested in this study. Green indicates relative fitness < 0 (outcompeted by wild type), red indicates relative fitness > 0 . Statistical significance was determined at week 3.

Table S1: Competitive fitness and growth rate data of randomly tested strains

- a) Relative fitness data for randomly tested strains. $n=3$ and error values are in s.e.m. * $p < 0.05$, ** $p < 0.01$
- b) Maximal growth rates for randomly tested strains. $n=3$ and error values are in s.e.m.
