

Supplementary Fig. 4

Supplementary Fig. 4. Relationship between protein distances and the number or timing of immunization(s). Epitopic distances (Gag, Pol, Nef combined; NetMHC derived) are plotted for vaccinees and placebos against: **(a)** the number of immunizations prior to infection, and; **(b)** the number of days between the last immunization and infection. The solid and dotted lines are regression lines through the vaccinees and placebo recipients, respectively.
