

## Supplementary Figure 1

Expression of type I and type III IFNs in fresh bat splenocytes at six hours post infection with TioPV. Fresh splenocytes from three individual bats (bats 1-3) were challenged with TioPV for 6 hours at a multiplicity of infection 0.1. The cellular RNA was extracted and IFN mRNA level was measured by qRT-PCR. Data are shown as fold change of expression obtained from comparison of the virus challenged and mock challenge group. The gene expression level had been normalized against GAPDH.
