

Figure S8. The JTT-ML91+-12 model fitted to the 1-PAM KHG codon substitution matrix. Each element $\log\langle O(\langle S \rangle(\hat{\tau}, \hat{\sigma}))_{\mu\nu} \rangle$ of the log-odds matrix corresponding to (A) single, (B) double, and (C) triple nucleotide changes in the JTT-ML91+-12 model fitted to the 1-PAM KHG codon substitution matrix is plotted against the log-odds $\log\langle O(S^{\text{KHG}}(1 \text{ PAM}))_{\mu\nu} \rangle$ calculated from KHG. Upper triangle, plus, circle, and cross marks show the log-odds values for synonymous pairs and one-, two-, and three-step amino acid pairs, respectively. The dotted line in each figure shows the line of equal values between the ordinate and the abscissa.
