Factor loadings above 40 from varimax rotation are noted with an asterisk and serve to illustrate which stimulant-cytokine combinations cluster together. The colored boxes denote which responses were included in each of the 11 factors. Each cytokine response was re-scaled to a 0-5 scale (0=undetectable, 1-4=quartile of detectable responses across all stimulants). The re-scaled responses in each set of colored boxes were averaged to create the cytokine factor scores. Thus, each child gets a score for each factor that ranges from 0 to 5.

[†] The IL-8 factor score was combined across Model 1 and Model 2.

[‡] Responses to PHA stimulant were highly correlated to one another and included by design as Factor 11.
