

Supplemental Figure S4. *In vitro* differentiation into Th1 cells. Naïve T CD4⁺ cells from the different genotypes were cultured in conditions that do or do not promote Th1 differentiation (see Materials and Methods), and after 5 days of culture the levels of IFN γ in the supernatant were assessed by ELISA. No differences were found for polarized cells among the different experimental groups. n= 3-6 T cell cultures from different donor mice per group. *, p<0.05 non-polarized vs. polarized WT.
