

Supplementary Figure 6. Netrin-1 mediates axon outgrowth through DCC. E15 DSC explants cultured on PDL/fibronectin substratum (DIV4) were pretreated with DCC-neutralizing antibody for 30 min and axon outgrowth was measured at 0 h and 3 h following netrin-1 (75 ng ml^{-1}) or vehicle treatment. Netrin-1-induced axon outgrowth is blocked by pretreatment with DCC-neutralizing antibody ($1 \text{ } \mu\text{g ml}^{-1}$). $n = 36$ spinal cord axons. * P value < 0.01 . Error bars represent s.e.m.
