

# **DNA Methylation Array Analysis Identifies Profiles of Blood-derived DNA Methylation Associated with Bladder Cancer**

Marsit et al

Data Supplement

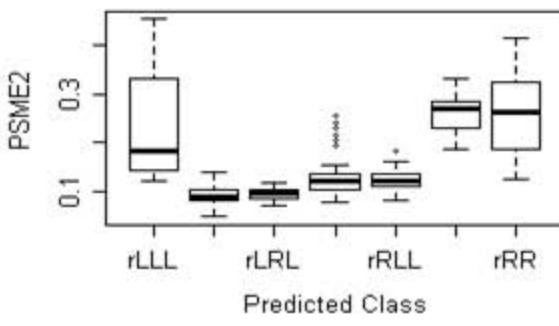

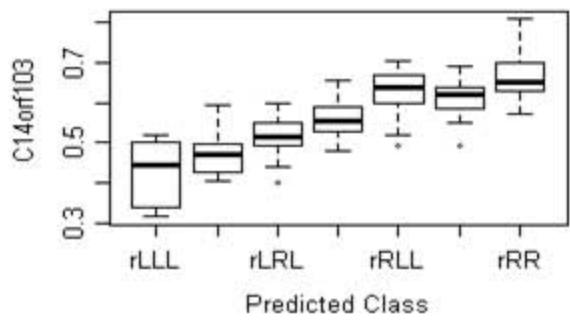

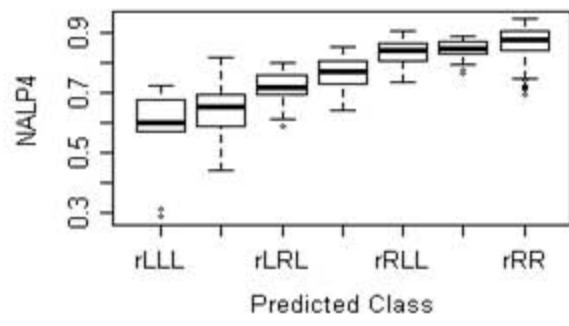

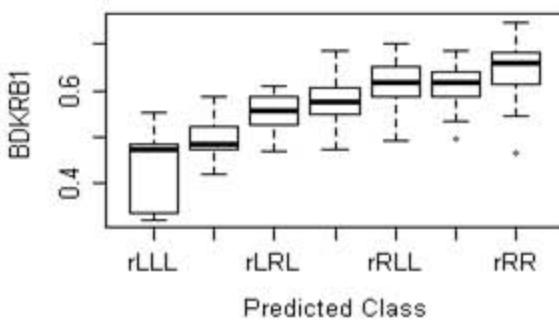

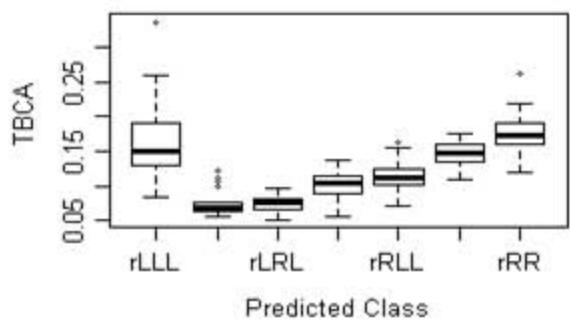

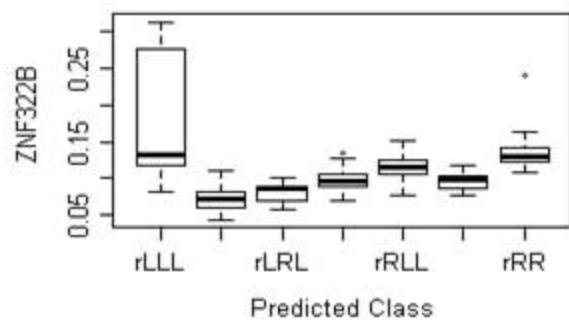

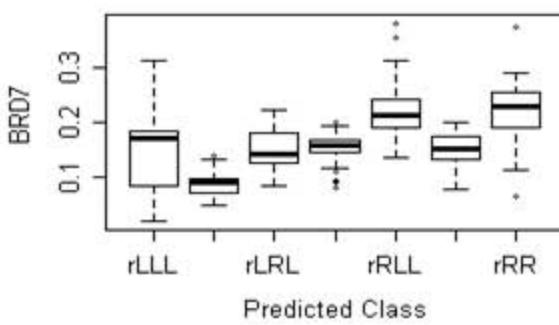

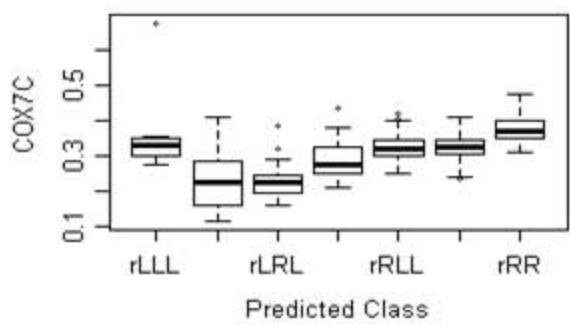

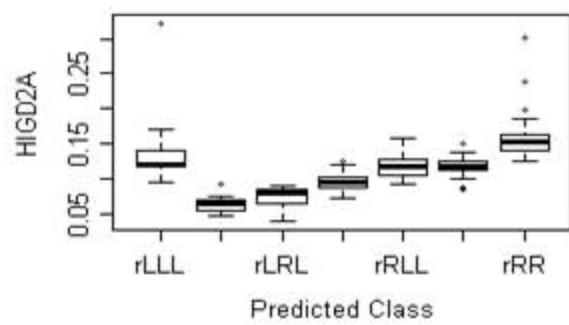

## **Supplemental Figure Legends**

**Supplemental Figure 1.** Boxplots of methylation values by class for each of the 9 loci selected for the panel within the testing data. Dark horizontal lines represent the mean, with the box representing the 25<sup>th</sup> and 75<sup>th</sup> percentiles, the whiskers the 5<sup>th</sup> and 95<sup>th</sup> percentiles, and outliers represented by dots.

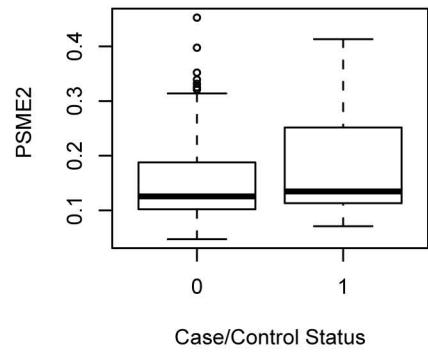

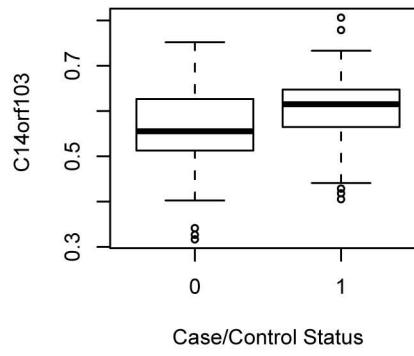

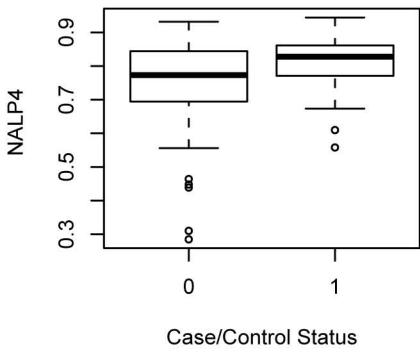

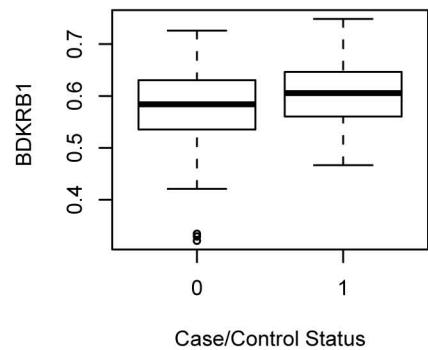

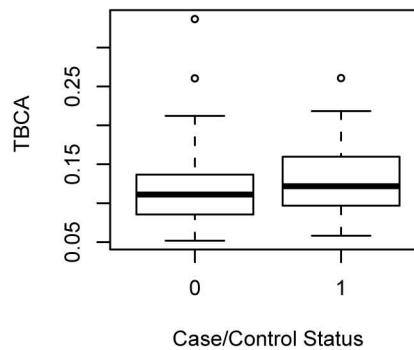

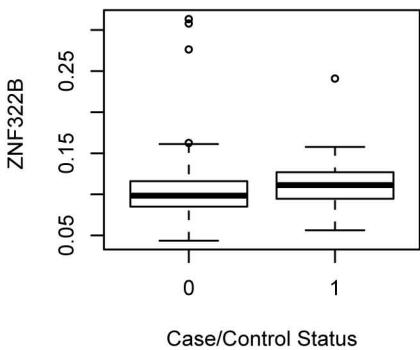

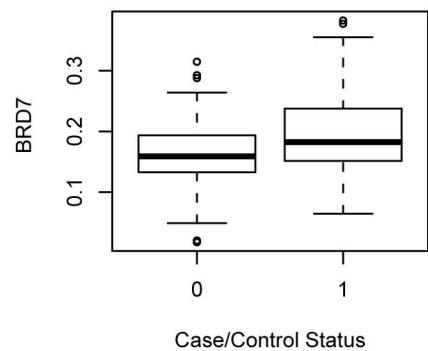

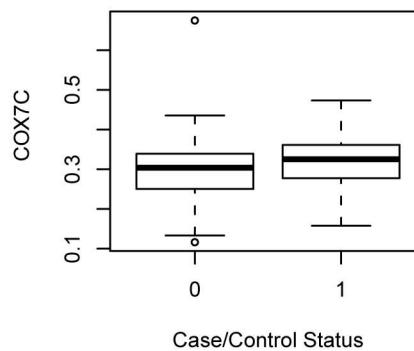

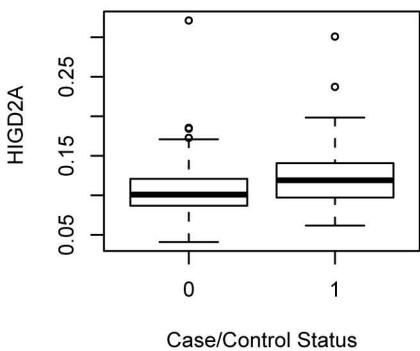

**Supplemental Figure 2.** Boxplots of methylation values of each of the loci in the testing data in controls (0) and cases (1). Dark horizontal lines represent the mean, with the box representing the 25<sup>th</sup> and 75<sup>th</sup> percentiles, the whiskers the 5<sup>th</sup> and 95<sup>th</sup> percentiles, and outliers represented by dots.

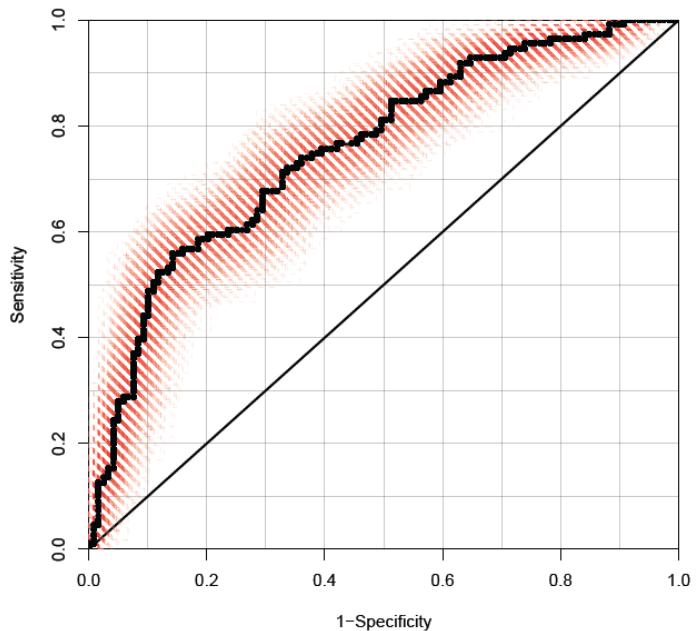

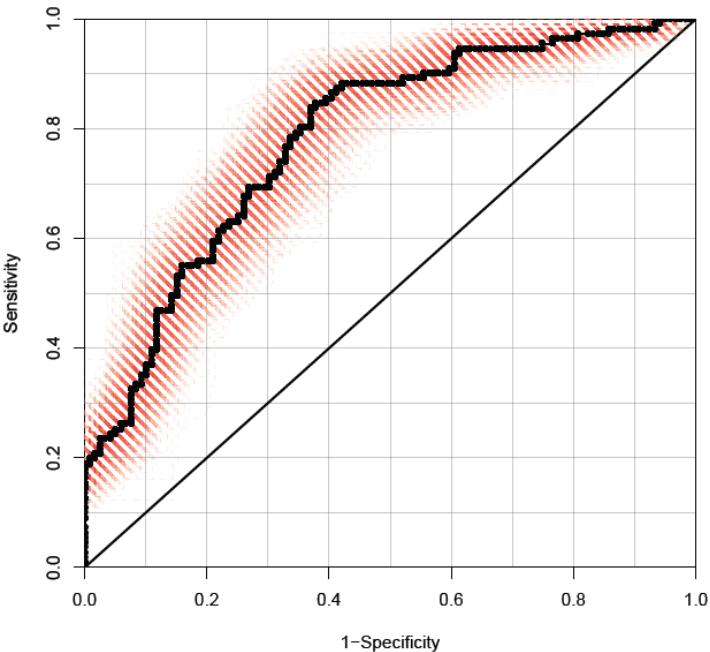

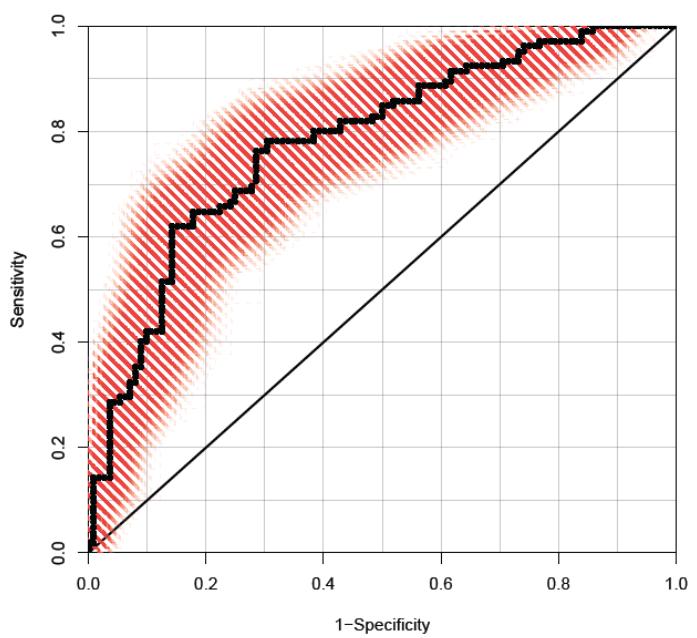

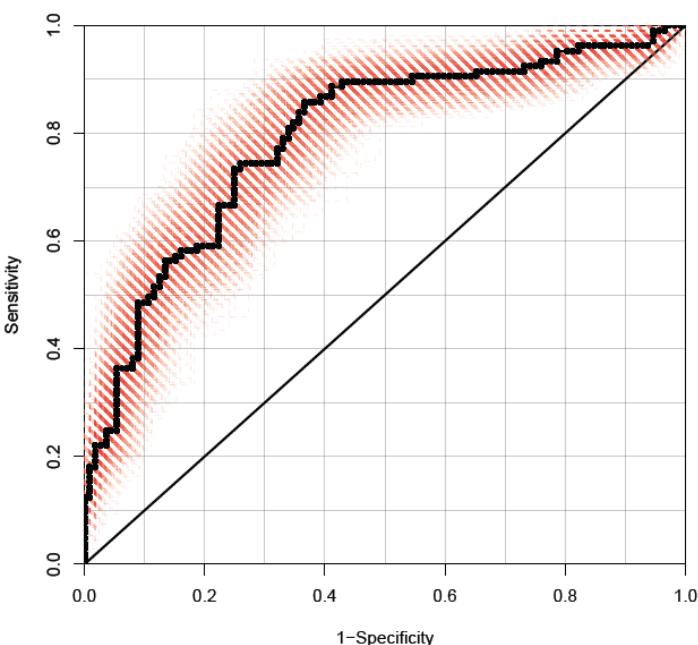

**Supplemental Figure 3.** Receiver operator curve (ROC) analysis of methylation-based bladder cancer prediction using LASSO method. (A) ROC based on a model fit using the 1000 most variable loci. (B) ROC based on a model fit using the 1000 loci most strongly associated with bladder cancer status. (C) ROC based on a model fit using the 1000 most variable and controlled for patient age, gender, smoking status, and family history of bladder cancer. (D) ROC based on a model fit using the 1000 loci most strongly associated with bladder cancer status and controlled for patient age, gender, smoking status, and family history of bladder cancer. Shaded areas represent bootstrap-derived 95% confidence intervals.
