**Blanchard et al, Sup. Fig. S7**

## **Supplemental Figure Legends**

### **Sup. Fig. S1 : Average length of the H-2<sup>b</sup> B6- and ERAAP–/– -specific pMHC I repertoire**

The length (mean +/- s.e.m.) of (**A**) H-2D<sup>b</sup>-bound and (**B**) H-2K<sup>b</sup>-bound peptides was plotted for unique H-2<sup>b</sup> B6- or ERAAP–/– -specific peptides, as well as for peptides shared between wild-type and ERAAP–/– mice. Number of peptides in each group is indicated between parentheses. p-values were calculated by unpaired two-tailed t-test based on the amino acid length.

### **Sup. Fig. S2. Amino acid composition of unique H-2K<sup>b</sup>-bound peptides recovered from B6.ERAAP–/– and wild-type B6 cells**

(**A,B**) Logo representation of unique H-2K<sup>b</sup>-bound (**A**) B6 or (**B**) ERAAP–/– peptide sequences analyzed independently according to their lengths shown on the X-axis. The height of each column is proportional to the degree of amino acid conservation and the height of each letter composing the column is proportional to its frequency at the given position. Numbers between parentheses indicate the number of peptide sequences analyzed. Groups containing less than 8 peptides (arbitrary choice) were not analyzed. Amino acids are colored as follows: acidic (red), basic (blue), hydrophobic (black), neutral (purple) and the others (green). (**C**) Unusually long and unique peptides were tentatively sorted into 2 categories according to the location of the bulge : between the N-terminus and the internal F/Y (“N-bulge”) or between the internal F/Y and the C-terminus (“C-bulge”). See Sup Table S2 for peptide annotation. Bars show the fraction of

peptides in each category. As some peptides could be classified in two distinct categories, the sum of percentages may be higher than 100. Numbers between parentheses represent the number of peptides showing an apparent consensus motif (therefore included in the analysis) over the total number of longer and unique H-2K<sup>b</sup>-bound peptides.

**Sup Fig. S3 : The YL9-H-2L<sup>d</sup>-specific, but not the AI9-H-2D<sup>d</sup>-specific response, is reduced in ERAAP<sup>-/-</sup> mice after infection with a low dose of virus**

(A) Frequencies of NP118- (an irrelevant peptide from LCMV), YL9- and AI9-specific CD8<sup>+</sup> cells assessed by tetramer labeling 7 days post-infection with 10<sup>5</sup> pfu of mCMV. (B) IFN- $\gamma$  production by splenocytes restimulated exogenously with TL9 (an irrelevant  $\beta$ -galactosidase peptide), YL9 or AI9 seven days post-infection with 10<sup>5</sup> pfu of mCMV. Each dot represents an individual mouse. Data are pooled from two separate experiments. \* : p < 0.05 ; \*\* : p < 0.005

**Sup Fig. S4 : Degranulation of CD8<sup>+</sup> T cells in response to N-terminally extended YL9 and AI9 peptides**

Degranulation of CD8<sup>+</sup> T cells from the spleen 7 days post-infection in response to exogenously added (A) YL9 and ML10 or (B) AI9 and DI10 (see additional methods). Bars show the mean +/- s.e.m. with N = 3 to 5 mice for each group. \* : p < 0.05

**Sup Fig. S5 : Sustained DI10-H-2D<sup>d</sup>-specific response by ERAAP<sup>-/-</sup> CD8<sup>+</sup> T cells is not due to preferred loading on ERAAP<sup>-/-</sup> APCs**

IFN- $\gamma$  production by CD8 $^{+}$  cells from the spleen 7 days post-infection in response to (**A**) exogenous AI9 or DI10 or (**B**) to naïve H-2 $^d$  ERAAP $-/-$  splenocytes previously pulsed with AI9 or DI10. Bars show the mean +/- s.e.m. with N = 3 to 5 mice for each group. \* : p < 0.05

**Sup Fig. S6 : Depletion efficiency after Facs-based or magnetic bead-based sorting**

(**A, B**) Splenocytes from infected H-2 $^d$  (**A**) ERAAP $+/-$  mice or (**B**) ERAAP $-/-$  mice were stained with CD8 and the AI9-H-2D $^d$  tetramer (input). Right dot plots show the FACS-sorted CD8 $^{+}$  AI9-H-2D $^d$  tetramer $^{-}$  population further labeled with DI10-H-2D $^d$  tetramer (see Fig. 6). Numbers represent percentages of tetramer $^{+}$  out of CD8 $^{+}$  cells. Results are typical of 2 experiments performed with 3 mice pooled per genotype. (**C, D**) Splenocytes from infected H-2 $^d$  (**C**) ERAAP $+/-$  mice or (**D**) ERAAP $-/-$  mice were stimulated with AI9 and IFN- $\gamma$ -producing cells were labeled, without fixation, using the Miltenyi IFN- $\gamma$  secretion assay (input) (see methods). Right dot plots show cells from the negative fraction after magnetic bead-based sorting, which were used in a subsequent regular IFN- $\gamma$  assay (see Fig. 6). Numbers represent percentages of IFN- $\gamma$  $^{+}$  out of CD8 $^{+}$  cells. Results are typical of 2 experiments performed with 3 mice pooled per genotype.

**Sup Fig. S7 : Degranulation by DI10-H-2D $^d$ -specific CD8 $^{+}$  T cells**

Degranulation of CD8 $^{+}$  cells in response to AI9 or DI10 after depletion of AI9-H-2D $^d$ -responding cells. As in Fig. 6, splenocytes from infected mice were stimulated with synthetic AI9 and IFN- $\gamma$ -producing cells were labeled, without

fixation, using the Miltenyi IFN- $\gamma$  secretion assay (see methods). Bars show degranulation by CD8 $^{+}$  IFN- $\gamma^{-}$  cells pooled from 3 spleens per genotype.

**Sup Fig. S8 : Similar numbers of DI10-specific CD8 $^{+}$  T cells induced by immunization with BMDCs**

Absolute numbers of DI10-H-2D $^d$ -specific CD8 $^{+}$  cells in lymph nodes 7 days after immunization with (A) AI9-pulsed BMDCs. Numbers of IFN- $\gamma$ -producing CD8 $^{+}$  cells in response to AI9 alone or to a mix of AI9 and DI10 were measured. Bars show the difference between both responses. Mean +/- s.e.m. (N = 3 mice).

Data representative of 2 independent experiments with 3 to 5 mice per group.

(B) Tetramer staining of lymph node cells from DI10-immunized mice depleted from AI9-H-2D $^d$  tetramer $^{+}$  CD8 $^{+}$  cells by FACS sorting, as in Fig. 6B,C. Bars show absolute numbers of CD8 $^{+}$  DI10-H-2D $^d$  tetramer $^{+}$  cells in the draining lymph nodes of three mice pooled per group.

205 D<sup>b</sup> peptides (C57BL/6 spleen cells)
