

Supplementary data

Figure 1s. SDS-PAGE of some of the Ni-NTA purified His-tagged proteins, HcyS, HcyD, HcyF, Sir and MetY.

Figure 2s. ¹H-NMR of L-alanine released from HcyS-Ala upon treatment with HcyD.

Figure 3s. HcyS-COSH (observed mass: 7708.6 Da, expected mass: 7704.82 Da, error: 0.05%) in the presence of MetY and O-acetyl-L-homoserine, 1 h incubation time, is converted to HcyS-homocysteine (observed mass: 7810.43 Da, expected mass: 7805.96 Da, error: 0.06%) and a higher molecular-weight adduct (7911.77 Da) whose identity is not known but could possibly be the HcyS-homolanthionine adduct.

Figure 4s. ¹H-NMR of L-homocysteine formed by the MetY-catalyzed addition of sulfide to O-acetyl-L-homoserine (red), 1 h incubation time. No homocysteine is formed in the absence of the enzyme (blue).

Figure 5s. MALDI-MS analysis of (a) HcyS-COSH (observed mass: 7713.25 Da, expected mass: 7704.82 Da, error: 0.1%) in the presence of MetZ and O-acetyl-L-serine, (b) HcyS-COSH (observed mass: 7711.93 Da, expected mass: 7704.82 Da, error: 0.09%) in the presence of MetZ and O-acetyl-L-homoserine (c) HcyS-COSH (observed mass: 7712.63 Da, expected mass: 7704.82 Da, error: 0.1%) in the presence of MetZ and O-succinyl-L-homoserine. No 7805.96 Da adduct corresponding to HcyS-Homocysteine adduct is formed in any of these cases.

Figure 6s. MALDI-MS analysis (a) HcyS-COSH (observed mass: 7712.64 Da, expected mass: 7704.82 Da, error: 0.1%) in the presence of HcyD forms HcyS-COOH (observed mass: 7696.85 Da, expected mass: 7688.82 Da, error: 0.1%, observed mass change: 15.79 Da) (b) HcyS-COSH (observed mass: 7712.53 Da, expected mass: 7704.82 Da, error: 0.1%) in the absence of HcyD.

Figure 7s. o-Phthalaldehyde derivatization of homocysteine .

Figure 8s. Sequence alignment of putative HcyS-like proteins from *Wolinella succinogenes*, *Clostridium kluyveri* DSM 555, *Chlorobium phaeobacteroides* BS1, *Geobacter uraniireducens* Rf4, *Carboxydotherrnus hydrogenoformans* Z-2901 and *Caldicellulosiruptor saccharolyticus* DSM 8903. All these organisms have HcyS-like proteins clustered with HcyD-like metalloprotease and O-acetyl/O-succinylhomoserine sulfhydrylase.

Table 1s. Primers used for cloning genes in this study.

Genes	Restriction sites	Vector	Primers
<i>sir</i>	NdeI/XhoI	THT	Forward primer: 5'-GGG TAG CAT ATG AGC CAC TAC ACC CTA CCC CCC TCC GTC G-3' Reverse primer: 5'-CCC TAC TCG AGT TAT CGT TTT TGA ATC CTC ACG CGC C-5'
