^a Gene Identifiers for Arabidopsis, rice and poplar are according to AGI code for Arabidopsis (the Arabidopsis information resource: <http://www.arabidopsis.org/index.jsp>), TIGR V4 pseudo-molecules annotation for rice (TIGR Rice Genome Annotation: <http://www.tigr.org/tdb/e2k1/osa1/index.shtml>), and *Populus trichocarpa* JGI genome assembly v1.1 (Populus genome release 1.1: http://genome.jgi-psf.org:8080/annotator/servlet/jgi.annotation.Annotation?pDb=Poptr1_1), respectively..

^b Chromosome positions of the *ICK/KRP* genes from Arabidopsis, *O. sativa* subsp. *Japonica* and *Populus trichocarpa*.

^c Predicted amino acid (aa) sequences were used to calculate the molecular mass (Mw) and theoretical isoelectric point (pl) with the ExPASy Proteomics Compute tool available from: http://ca.expasy.org/tools/pi_tool.html; kDa - kiloDaltons.

^d It has a splicing variant not described here: At3g19150.2 (*Arath:KRP6.2*) NP_974338 (176 aa, pl/Mw: 4.54 / 18.929 kDa). Information in the table corresponds to At3g19150.1 (*Arath:KRP6.1*).

^e At2g32710 has two polymorphic variants which we believe are miss-annotated as splicing variants: At2g32710.1 (870 bp) and At2g32710.2 (861 bp). At2g32710.1 is a cDNA (accessions: DR354760 and AY087958) from WS/Ler ecotypes while At2g32710.2 (accessions: AU238423, AK117586, and BX835336) is from Col-0 and therefore used in this study.

^f The original accession (Os06g11050) encodes a polypeptide of 410 aa which is not supported by the cDNA sequence. In this study we used a cDNA clone (DQ229363) for the analysis.

^g There is another accession AAG16867 (242 aa, pl/Mw: 9.16 / 26.750 kDa) for the *Oryza:KRP4* (Os10g33310), but there is no

information on cDNA yet.

^h *Populus trichocarpa* genomic scaffold “scaffold_130”.
