

## A. KU812

## B.

### Supplemental Figure Legend

**Supplemental Figure S1.** A. KU812 cells were treated with 5  $\mu$ M GO-203 each day for 2 days in the absence and presence of 5  $\mu$ M zVAD-fmk for the last day. Cells were stained with PI/Annexin V and analyzed by flow cytometry. The results (mean $\pm$ SD of three determinations) are expressed as the percentage of cells with late apoptosis/necrosis. Statistical significance was determined by the Student's *t*-test. B. Lysates were immunoblotted with the indicated antibodies.
