

## Supporting Information

### Experimental Procedures

**Methods:** Gas chromatography coupled mass spectrometry (GC-MS) was carried out on Agilent Technologies 6890N Network GC-system (Agilent, Palo Alto, CA, USA) GC with the Agilent Technologies 5975 inert MS detection and autosampler (Agilent). The injection temperature was set to 275 °C. Separation was performed on a CP-Sil 8 capillary column (50 m × 0.25 mm I.D., 0.25 µm film thickness). Helium was used as the carrier gas at a flow of 1.2 mL/min. The split was opened after 2 min. The column temperature for the CP Sil-8 was programmed from 45°C to 245°C with 20°C/min. The final temperature was held for 10 minutes. Detection was based on electron ionization (EI) in the full scan mode (*m/z* 50-500). Nitrogen was used as reagent gas at a flow rate of 3 mL/min. The ion source temperature was 230°C.

<sup>1</sup>H, <sup>13</sup>C and <sup>19</sup>F NMR spectra recorded on 300 MHz NMR spectrometer (Bruker, Billerica, MA, USA), using chloroform-D (CDCl<sub>3</sub>) as the solvent. The processing parameters were 300 MHz for <sup>1</sup>H, 75.5 MHz for <sup>13</sup>C and 282 for <sup>19</sup>F and a digital resolution of 0.20 Hz for <sup>1</sup>H, 0.61 Hz for <sup>13</sup>C and 0.65 Hz for <sup>19</sup>F.

Electrospray ionization (ESI) (*m/z* 100.0-1000.0) of the salts was performed as flow injection analysis on a Thermo (Waltham, Massachusetts, USA) LCQ Deca quadrupole ion trap MS. The mobile phases used were 0.1% formic acid and methanol. The gradient was started at 90% water and over 25 min went to 5% solvent water.

**Table S1:**  $^1\text{H}$  NMR chemical shifts  $\delta$  [ppm] and couplings  $^nJ(^1\text{H}^1\text{H}, ^1\text{H}^{19}\text{F})$  [Hz] of F-PBDEs 35-F5' (**3d**), 47-F3 (**3g**), 99-F3' (**3i**), PBDEs 35 (**3d**), 47 (**3f**) and 99 (**3h**) in  $\text{CDCl}_3$ .
