Suppl. figure 1: Recovery from HU treatment of *dma1Δ dma2Δ* cells. Exponentially growing cultures of wild type (W303), *hsl1Δ* (ySP4699) and *dma1Δ dma2Δ* (ySP1569) cells were arrested in G1 by α -factor and released from G1 arrest in YEPD containing 200 mM HU at 25°C (time = 0). After 120 minutes, cells were released from HU (arrow). Cell samples were taken at the indicated times to determine mitotic spindle formation and elongation by indirect immunofluorescence with anti-tubulin antibodies.
