

## SUPPORTING INFORMATION

The anaerobe-specific ORP complex of *Desulfovibrio vulgaris* Hildenborough is encoded by two divergent operons co-regulated by  $\sigma^{54}$  and a cognate transcriptional regulator.

**Figure S1.** *orp* gene cluster organization in various microbial species using STRING (von Mering et al., 2005) and phylogenetic analysis of DVU2103, DVU2104 and DVU2108 genes and their homologues published by Scholten (Scholten et al., 2007). Homologues of DVU2103 (yellow), DVU2104 (green), DVU2105 (red), DVU2106 (grey), DVU2107 (purple), DVU2108 (orange) and DVU2109 (brown) are indicated. Genes are not drawn to scale. The direct boarding of ORFs indicates overlapping of start and stop codons, while space between ORFs indicates intergenic region larger than 1 base pair.
