

Figure S4. Sirtuin inhibitors and HDAC inhibitors show poor activity and fail to cooperate in healthy PBMCs. A-C, Healthy PBMCs were incubated in 96-well plates with or without sirtinol, cambinol, BU, or VA at the indicated concentrations. Viability was assessed 48 h later by PI cell staining and flow cytometry. CI values refer to the highest drug concentrations used. Results are means \pm SD of three independent experiments with three different donors.
