

Figure S15. Synergistic interaction between FK866 and VA in 697 pre-B-cell leukemia cells. 697 cells were incubated with or without FK866 at the indicated concentrations for 48 h. Thereafter, VA was added at the indicated concentrations. Viability was assessed 48 h later by PI cell staining and flow cytometry. CI values refer to the highest drug concentrations used. CI^{CT}s are shown in the lower inset.
