P<sup>a</sup> values were calculated using the multivariable logistic regression model and compared Tertile-2 with Tertile-3; P<sup>b</sup> values compared Tertile-1 with Tertile-3.

Model 1 was used to adjust for age and gender in the logistic regression analysis.

Model 2 was used to adjust for age, gender and other vascular risk factors including SBP, BMI, hypercholesterolemia, current smoking, current drinking, and family history of stroke.

OR indicates odds ratio; 95% CI, 95% confidence interval; ICH, intracerebral hemorrhage; LDL-C, low-density lipoprotein cholesterol; HDL-C, high-density lipoprotein cholesterol; TC, total cholesterol; TG, triglycerides; SBP, systolic blood pressure; BMI, body mass index.
