

B

Supplemental Figure S5. Terpene-mediated response of *Ceratitis capitata* males exposed to pure synthetic monoterpene compounds in flight tunnel assays. (A) Mean percentage of flies landing on paper disks supplemented with 30 μ L of water or pure synthetic compounds. Results are average \pm s.e.m. ($n = 10$). Treatments with different letters are significantly different at $P < 0.05$ using Fisher's Protected LSD test. (B) Terpene-mediated landing of flies on limonene (LIM), nerol (NER) or water control (C) disks.
