

Supplementary information, Figure S3 Knockdown of TRF2 decreases its binding to target genes.

ChIP-qPCR analysis with anti-TRF2 antibodies was carried out using control (shGFP) or TRF2 knockdown (shTRF2-1) cells. The qPCR data were normalized to input and the results were normalized to control levels. Error bars indicate standard errors ($n = 3$). p values were calculated by Student t test and * indicates $P < 0.05$.
